## **Press Release**

### **Main Findings for the Palestinian National Accounts 2003**

#### **Recovery for Palestinian economy compared to 2002**

#### **Substantial growth in national accounts indicators 2003**

The Palestinian Economy is still suffering from economic crises, caused by the Israeli measures in the Palestinian Territory since the break down of Al-Aqsa Intifada in September/2000. There was a substantial decline in the performance of different socioeconomic fields, which had reached its core in 2002. In 2003, the Palestinian economy had accomplished a slight improvement in most economic activities.

The findings of the National Accounts at constant prices of the Remaining West Bank and Gaza Strip for the year 2003, showed that the value of the Gross domestic product had reached 4010.8 million US\$ at constant prices (1997 is the base year), with a growth rate by 4.5% compared to the year 2002, and a decline by 11.1% compared to 1999. Although the value of GDP per capita was 1184.8 US\$, with a decline of 0.5% compared to 2002, and 25.5% with the 1999. The Gross national Income amounted to 4372.5 million US\$, by 7.0% growth rate compared to 2002 and a decline by 17.3% compared to 1999. GNI per capita was 1291.6 US\$ through 2003, to set down an increase by 1.9% compared to 2002 and a decline by 31.6% compared to 1999. The Gross disposable income amounted to 5869.1 million US\$ in 2003, increased by 12.7%, 3.2% compared to 2002, 1999 respectively. GDI per capita accomplished a growth rate by 7.3% compared to 2002, and declined by 14.7% compared to 1999.

The 2003 findings showed also an increase by 8.3% in final consumption which reached 5371.7 million US\$. The household final consumption formed 4128.1 million US\$, with a 12.4% growth rate compared to 2002, and declined by 1.2% compared to 1999. The value of gross capital formation was 1126.3 million US\$ during the year 2003 accomplishing a growth rate by 66.1% compared to 2002 and a decline by 45.9% compared to 1999. The deficit in trade balance for net exports of goods and services amounted to 2487.1 million US\$.

#### **Performance of Main Economic Activities**

The results indicate the following:

- The gross value added for **Agriculture** activity increased by 11.0% during 2003 in relation to 2002, while declined by 10.4% compared with 1999
- The gross value added for Manufacturing (**Mining, Manufacturing, Electricity and Water Supply**) in Remaining West Bank and Gaza Strip declined by 27.8%, and 35.6% during 2003 compared to 2002 and respectively 1999.
- The gross value added for **Construction** activity grew by 65.5% during 2003 compared to 2002, while declined by 76.5% compared to 1999.
- The gross value added for **Wholesale and Retail Trade and Financial Intermediation** activities declined by 9.6%, 3.8% compared to 2002 respectively, and declined by 23.6%, 17.0% compared to 1999 respectively.
- The gross value added for **Transport, Storage and communication** activities declined by 0.4% during 2003 compared to 2002, and declined by 63.7% compared to 1999 .
- The Gross Value added for **Services** activities grew by 11.1% compared with 2002 and by 11.0% compared 1999.

# Concepts and Definitions

## 1. General terms

### Statistical unit

The United Nations System of National Accounts SNA 1993 defines two main types of statistical units:

### Institutional unit-Enterprise

An institutional unit is an economic entity that is capable, in its own right, of owning assets, incurring liabilities and engaging in economic activities and in transactions with other entities.

### Establishment

An establishment is an enterprise, or part of an enterprise, which produces only a single group of goods (with the possibility of production from secondary activities) in which the principal productive activity accounts for most of the value added.

Breaking down institutional units into establishments serves in creating more consistent statistical units in the productive sense.

### Economic Activity:

It is defined as a group of establishments engaged on the same, or similar, kinds of activity. This definition is in agreement with the International Standard Industrial Classification of All Economic Activities (ISIC). The highest level of aggregation is called the classification group, and the lowest level is called division. The various groups are determined in accordance with the nature of production, its use, and its structure of inputs. The tables in this report include classification standards linked with the Palestinian economy.

## 2. Production concepts

### Production

Production is measured during a certain period of time by the value of the final products of goods and services produced by a certain establishment capable of being provided to other units though they can be self-consumed or for the purposes of self gross fixed capital formation. Production includes two categories: Final products and the so-called (under operating products), which means products that take long time to produce such as livestock and establishment works. The value of the majority of goods can be estimated at the moment the production process is completed. However, the production of some goods may exceed the accounting period (such as the case of under operating products). The value of such products is estimated and registered during that accounting period, such as the case of establishment works and winter crops.

### Production can be classified as follows:

**Market outputs:** including goods and services sold at market prices such as most of the goods and services sold at warehouses and retail stores

**Outputs of private account:** including goods and services consumed at the same production unit such as agricultural products, which are produced and consumed at the same farm

**Other non-market outputs:** These are the goods and services produced by the government or non-profit institutions that are given free of charge or for minimal prices, including educational services provided by the government.

### **Intermediate consumption**

Intermediate consumption consists of the value of the goods and services consumed as inputs by a process of production. It is measured during a specific period in time in a way similar to measuring production. Intermediate consumption is estimated by purchase price, which is defined as the producers' price plus transportation and wholesale and retail trade margins. The value of the gross intermediate consumption on the level of the total economy is the same whether calculated by purchase or producers' price. However, on the detailed level, the two evaluations vary.

### **Value added**

Value added is a central concept of production and refers to the generated value of any unit that carries out any productive activity. Gross value added is defined as the value of gross production less the value of intermediate consumption. The net value added is defined as the gross value less the value of fixed capital consumption. The net value added reflects the performance of the economy in a better way; however, since it is difficult to measure the fixed capital consumption accurately, the concept of gross value added is more used.

Value added at producers' price is the difference between output at basic prices and the value of the intermediate consumption at purchase price plus taxes (less subsidies) on production. However, if taxes and subsidies are excluded, value added will be obtained in basic prices.

### **Gross Domestic Product or GDP**

Gross Domestic Product or GDP is the summary measure of the output or production during a certain period in time. Estimate of GDP, like the output and the value added, can vary according to taxes and subsidies taken into consideration. GDP is usually estimated at market prices, producers' prices, or basic prices.

## **3. Final consumption groups**

### **Final consumption**

Households, government, and non-profit institutions carry out the final consumption registered in the National Accounts. Therefore, the establishments' consumption is not considered final consumption since products used in the production process are considered intermediate consumption.

Households' final consumption is registered in purchase' price. It consists of expenditure on all goods and services excluding expenditure on building and construction, which are considered gross fixed capital formation for the property owners. Renting accommodation is classified as final consumption spent by households.

Government and non-profit institutions consumption is dealt with in the SNA 1993 similarly to the way it was dealt with in SNA 1968; it is measured by output value less sales revenues. Expenditure of the two sectors can be divided into two types: individual and collective. The first includes spending that benefits individuals on medical services, for instance. Collective expenditure has a public nature such as the government's spending on defense and security.

### **Gross capital formation**

Gross capital formation can be divided into three components: gross fixed capital formation, change in inventory, and net acquisitions of valuables. Henceforth, gross capital formation (or

investment) can be defined as the total value of the three aforementioned components. It is measured at purchase price, as is the case with measuring consumption.

### **Exports and imports of goods and services**

They include trading goods and services among residents and non-residents and selling, barter, and gifts.

## **4. Income components**

### **Compensation of employees**

Compensation of employees is the total remuneration, in cash or in kind, including social security contributions, payable by an enterprise to an employee in return for work done by the latter.

### **Tax on a product**

Taxes are compulsory cash or in kind payments payable by producers to the general government. Taxes on a product consist of taxes on products payable on goods and services at production, sale, or exchange and other taxes payable on production by resident producers as a result of carrying out the production process.

### **Taxes and duties on imports, excluding VAT**

Taxes and duties on imports consist of taxes on goods and services that become payable at the moment when the goods cross the national or customs frontiers of the economic territory.

Other imports taxes (excluding VAT) include sales tax, Excise (imposed on certain goods like tobacco and fuel) and other taxes that can be imposed on services...etc.

### **Subsidies on product**

Subsidies are current unrequited payments that government units make to local producers or importers. They consist of subsidies on products made to each unit of produced goods or services and other subsidies on product made by the government to resident producers as a result of carrying out the production process.

### **Gross Operating surplus**

The operating surplus totals the value of the gross value added at basic prices less the total of compensation of employees (including compensations payable to non-residents) less taxes (minus subsidies on product). Gross operating surplus can be analyzed to net operating surplus and the fixed capital consumption.<sup>1</sup>

However, this distinction was not possible in the Palestinian National Accounts since data were unavailable.

## **Property income**

---

<sup>1</sup> A line must be drawn between the consumption of fixed capital and the book consumption of the fixed capital used in commercial accounting basically for tax purposes. Consumption of fixed capital measures the reduction of fixed assets as a result of use and depreciation. It is a variable related to future view.

Property income is the income receivable by the owner of a financial asset or a tangible non-produced asset (such as land) in return for providing funds to, or putting the tangible non-produced asset at the disposal of another institutional unit.

### **Gross National Income<sup>2</sup>**

GNI (gross national income) measures the gross value of the initial earned income of residents. It is the income incurred by carrying out production activities or by owning financial assets or land or subsoil assets. GNI can be measured by adding the following components:

- Compensations of employees payable to residents
  - Operating surplus of production units (residents by definition)
  - Taxes on production and imports less governmental subsidies
  - Income generated by financial assets, lands, subsoil assets earned by residents
- Less
- Income generated by financial assets, lands, subsoil assets paid by residents

GNI can be estimated in a different way by adding the initial income earned by residents less initial income earned by non-residents from the GNI.

### **Gross disposable income**

Gross disposable income measures available income of residents, which can be spent on consumption of goods and services (locally produced or imported goods and services) or for savings. Gross disposable income can be measured by adding the following components:

GNI, current payable current taxes on income and wealth and others payable to residents, residents social security contributions and revenues, net insurance premiums and claims other than life insurance payable to residents, local different transactions, current transactions of non-residents (which can take any of the aforementioned forms)

Less

The same articles above on payments side.

Gross disposable income can also be measured in a simplified way by adding the net transactions from

### **The Remaining West Bank**

The remaining West Bank means the West Bank excluding the part of the governorate of Jerusalem, which Israel annexed by force in the aftermath of the June 1967 war.

### **Note:**

Roundation of the values of the component of the variables result in some differences, this is noticed in comparing the value of variables with it's components.

---

<sup>2</sup> Formerly known as Gross National Product GNP in SNA 1968 but the term became absolute in SNA 1993.
