2. Definition, concepts, and classifications

2.a. Definition and concepts

Definition:
This information only refers to 17.19.2 (a)

The indicator tracks the proportion of countries that have conducted at least one population and housing census in the last 10 years. This also includes countries which compile their detailed population and housing statistics from population registers, administrative records, sample surveys or other sources or a combination of those sources.

2.b. Unit of measure

2.c. Classifications

3. Data source type and data collection method

3.a. Data sources

ECOSOC resolution E/RES/2015/10 establishing the 2020 World Population and Housing Census Programme requests the Secretary-General to "monitor and regularly report to the Statistical Commission on the implementation of the Programme". In response to this request UNSD regularly monitors the progress of implementation of population and housing censuses across Member States. UNSD sends a survey to all countries soliciting detailed metadata on census methods at three points (beginning, mid, end) over the 10-year spanning a census decade (currently the 2020 census round covering the years 2015-2024). In addition, information is also collected through the annual questionnaires sent to countries as part of the UN Demographic Yearbook collection.

3.f. Data compilers

3.g. Institutional mandate

4. Other methodological considerations

4.a. Rationale

Population and housing censuses are one of the primary sources of data needed for formulating, implementing and monitoring policies and programmes aimed at inclusive socioeconomic development

and environmental sustainability. Population and housing censuses are an important source for supplying disaggregated data needed for the measurement of progress of the 2030 Agenda for Sustainable Development, especially in the context of assessing the situation of people by income, sex, age, race, ethnicity, migratory status, disability and geographic location, or other characteristics.

In recognition of the above, the ECOSOC resolution E/RES/2015/10 establishing the 2020 World Population and Housing Census Programme urges Member States to conduct at least one population and housing census during the period from 2015 to 2024, taking into account international and regional recommendations relating to population and housing censuses and giving particular attention to advance planning, cost efficiency, coverage and the timely dissemination of, and easy access to, census results for national stakeholders, the United Nations and other appropriate intergovernmental organizations in order to inform decisions and facilitate the effective implementation of development plans and programmes.

The indicator tracks the proportion of countries that have conducted at least one population and housing census in the last 10 years and hence provides information on the availability of disaggregated population and housing data needed for the measurement of progress of the 2030 Agenda for Sustainable Development.

2. Definition, concepts, and classifications

2.a. Definition and concepts

Definition:

This information refers only to 17.19.02b: Proportion of countries that have achieved 100 per cent birth registration and 80 per cent death registration

According to the Principles and Recommendations for a Vital Statistics System, Revision 3 (https://unstats.un.org/unsd/demographic/standmeth/principles/M19Rev3en.pdf), a complete civil registration is defined as: "The registration in the civil registration system of every vital event that has occurred to the members of the population of a particular country (or area), within a specified period as a

result of which every such event has a vital registration record and the system has attained 100 per cent coverage."

In a given country or area, the level of completeness of birth registration can be different from the level of completeness of death registration.

There exist several methods for the evaluation of completeness of birth or death registration systems. An elaboration of these methods is available at Principles and Recommendations for a Vital Statistics System, Revision 3. The evaluation and monitoring of quality and completeness of birth and death registration systems are addressed in Part three, sub-Chapters: D. Quality assessment methods; E. Direct versus indirect assessment, and F. Choosing appropriate methods for assessing completeness and qualitative accuracy of registration and register-based vital statistics (para 579 to 622).

Indicator 17.19.02b has two parts; the first concerning the birth registration and the second concerning the death registration of each individual country or area.

2.b. Unit of measure

2.c. Classifications

3. Data source type and data collection method
3.a. Data sources

3.b. Data collection method

The national level of completeness of birth and death registration is provided by the National Statistical Offices of all countries and areas to the United Nations Statistics Division as part of the annual data collection for the United Nations Demographic Yearbook. This information is usually reported as part of the metadata worksheets of the Vital Statistics questionnaire. The template of this questionnaire is available at: https://unstats.un.org/unsd/demographic-social/products/dyb/index.cshtml#questionnaires

3.g. Institutional mandate

4. Other methodological considerations

4.a. Rationale

The introduction of indicator 17.19.02b as part of the SDG global framework reflects the recognition of the fundamental role of the civil registration system to the functioning of societies, and the legal and protective advantages that it offers to individuals. The essential purpose of civil registration system is to furnish legal documents of direct interest to individuals. Aside from the direct and overarching importance of civil registration to the public authorities, in that the information compiled using the registration method provides essential data for national and regional preparation and planning for medical and health-care programmes, the role played by civil registration in proving, establishing, implementing and realizing many of the human rights embodied in international declarations and conventions reflects one of its most important contributions to the normal functioning of societies.

4.b. Comment and limitations

4.c. Method of computation

The two sub-indicators of the indicator 17.19.02b are expressed as proportions: at the global level, the proportion of countries that have achieved 100 per cent birth registration is measured as the number of countries that have achieved 100 per cent birth registration divided by the total number of countries. The computation is done in an analogous manner for the death registration part as well as for the regional measurements of both birth and death registration sub-indicators.

The latest compiled data for this indicator are part of the Statistical Annex to the annual SG's progress report, available at https://unstats.un.org/sdgs. These data are compiled using the country-reported information on availability and completeness of birth and death registration data at the country level, to the United Nations Demographic Yearbook, via the Demographic Yearbook Vital Statistics questionnaire and accompanying metadata. United Nations Demographic Yearbook collection and associated online compilations are published by the United Nations Statistics Division of the Department of Economic and Social Affairs. Please refer to: https://unstats.un.org/unsd/demographic-social/products/dyb/index.cshtml#overview

At the present time, the thresholds used for compiling the data for the indicator 17.19.02b are 90 per cent for birth registration and 75 per cent for death registration, due to the classification that has been used in the Demographic Yearbook metadata questionnaire on vital statistics. This classification is modified to enable reporting according to the exact formulation of the indicator 17.19.02b.

4.d. Validation

4.e. Adjustments

4.f. Treatment of missing values (i) at country level and (ii) at regional level

• **At country level**

No attempts are made to provide estimates of completeness of birth and death registration, when such information is not reported via the United Nations Demographic Yearbook data collection.

• **At regional and global levels**

Not applicable

4.g. Regional aggregations

The regional values of this indicator are compiled as follows:

17.19.2 (b.1) Number and proportion of countries with birth registration data that are at least 90 per cent complete: The number of countries or areas on each of the listed regions with birth registration data that are at least 90 per cent complete, and the proportion of such countries or areas to the total number of countries or areas in the respective region.

17.19.2 (b.2) Number and proportion of countries with death registration data that are at least 75 per cent complete: The number of countries or areas on each of the listed regions with death registration data that are at least 75 per cent complete, and the proportion of such countries or areas to the total number of countries or areas in the respective region.

4.h. Methods and guidance available to countries for the compilation of the data at the national level

Principles and Recommendations for a Vital Statistics System, Revision 3 , United Nations, New York, 2014

4.i. Quality management

4.j Quality assurance

Principles and Recommendations for a Vital Statistics System, Revision 3, Part three, I, "Quality assurance and assessment of civil registration and register based vital statistics"

Follow up with National Statistical Offices as part of the annual United Nations Demographic Yearbook data collection, validation and processing.

4.k Quality assessment

5. Data availability and disaggregation

Data availability:
For the current availability please refer to the Statistical Annex SG's progress reports, available at https://unstats.un.org/sdgs.

Time series:

Disaggregation:
By their definition, the sub-indicators of the indicator 17.19.02b refer to the national levels of completeness of birth and death registration.

However, knowledge of the birth and death registration completeness at sub-national administrative areas, as well as by income, sex, age group, disability status, etc. is very important for monitoring and improving the functioning of birth and death registration systems.

6. Comparability / deviation from international standards

Sources of discrepancies:

Not applicable since the information is derived from country reporting.
