## Introduction

In the summer of 1967, just after the Six-Day War brought the West Bank and Gaza Strip under Israeli control, the Israeli Central Bureau of Statistics (ICBS) supervised a census in these territories. The census included an impressive array of questions about individuals, households, and the quality of residences. Indeed, it included much the same range of questions that Israel had asked or would ask of its own population in the 1961 and 1972 censuses, respectively.

Questions deal with age, sex, religion, place of residence, educational attainment, occupation, industrial sector, income, household structure, health, female fertility, and housing conditions. Moreover, the enumeration also asked two crucial questions about refugee status: Had the individual lived prior to the 1948 War in the area that became the State of Israel? And, Was the individual living in or outside of a refugee camp at the time of the 1967 enumeration?

The ICBS prepared seven volumes of reports based on this enumeration. These constitute the first modern census reports on the Palestinian population (except for the reports based on the 1961 Israel population census, which is limited to Palestinian citizens of Israel at the time). Jordanian and Egyptian censuses during the preceding decade had canvassed the West Bank and Gaza Strip, respectively, but even the former had published only a few general tables. Yet these volumes have not been used extensively in the writing on the evolution of the occupied territories, particularly during the last quarter century. One reason for this situation is that they are not widely available. Also, even when in hand, the published volumes are not easy to use; they are subject to all the limitations of older volumes filled with numbers – indeed, all the limitations of older volumes published as quickly as possible in order to be of use at the time. They have not been made machine-readable until now.

The Levy Economics Institute therefore now offers the content of these published volumes in machine-readable form (in Excel and PDF format), free of charge, in the hope that the data can be exploited by researchers interested in a fuller understanding of the evolution of the social history of the Palestinian people in the territories. The material in the tables is of great value even on its own, but its value is radically enhanced when thought of in the context of the two later censuses of the Palestinians in the same area: the 1997 and 2007 censuses of the Palestinian Authority's Central Bureau of Statistics (PCBS). Tabular data from these censuses are available on the website of the PCBS, and public-use sample datasets (explained below) can also be obtained, either from an online archive of such documents (IPUMS International) or from the PCBS itself. Alone, the information from 1967 provides a snapshot of a population at a

particular moment in time—a critical historical moment, as things turned out, and 30 years prior to the next census benchmark for them. Together with the later material, the 1967 information provides a historical snapshot to which later ones can be compared.

In addition to the Excel tables, the online database includes a PDF version of the introduction to six of the seven volumes of reports. The introductions include the ICBS analysis of major findings, in addition to extensive descriptions of how the enumeration and data processing were carried out and discussions of possible errors, from sampling and other sources.

### **Organization of the 1967 Census Enumeration and Reports**

The census was conducted in the West Bank, Gaza Strip, Golan Heights, and (a month later) East Jerusalem. However, we have omitted the few tables dealing with the Heights from the online collection, as they pertain to a relatively small and non-Palestinian population. The remaining tables in the six volumes of reports include 44 found in analytic introductory sections and another 221 that compose the main text of the volumes. Many of the text tables are complex, dealing with several population characteristics at once. And some are also very long, including detailed social data for each village, town, and city and subtotaled by regions.

Like the Israeli censuses of the time (and the American ones), the enumeration effort was divided into two parts: everyone was asked a brief series of questions (*the short-form questionnaire*) and a sample of the population were asked a much fuller series of questions (*the long-form questionnaire*). The difference is critical for understanding the military and administrative context for the work. While the ICBS directed the enumeration and the preparation of the reports, most of the work was carried out for the Israel Defense Force (IDF). The short form, completed for the entire population, included the name, sex, age, religion, and street address of every resident in every household or institution. The result amounted to a population register no doubt of use for the military. It is also the basis for the tabulations in volume 1 of the reports. The next four volumes were based on sample data from the long form. The final two volumes were officially carried out not for the IDF but for the Jerusalem Municipality; it covered the population of East Jerusalem (as defined after the War) from both short and long forms.

Israeli army personnel, under the supervision of the ICBS served as census takers; a curfew was declared for the day of the enumeration, and the population received ID cards after

being enumerated. A similar procedure had been followed in the first Israeli population census of 1948. The ICBS chose a more selected group of soldiers, with a better command of Arabic, to administer the more detailed long form to the sampled population; these soldiers received some 12 hours of training by the ICBS. “Enumeration Districts with an average of 55 households” were created and “the sample was a sample of enumeration districts (cluster sample) drawn systematically from geographical strata” (ICBS 1967–70, Vol. 3, p. xv). In the West Bank (excluding East Jerusalem) and Gaza Strip the goal was to sample 20 percent of the population; in East Jerusalem, 50 percent. The Introductions to volume 1 and volumes 2 and 3, respectively, describe the 100 percent and sample enumerations in more detail for the West Bank and Gaza Strip. The Introduction to volume 6 provides the same information for East Jerusalem (the long-form questionnaire was very slightly modified for that area). Copies of the census questionnaires, in English translation, may be found in the introductions. Apparently, for actual use in the enumeration, the short-form questionnaire was printed in Arabic and Hebrew; the long-form questionnaire only in Hebrew (or so the forms appear in the Hebrew versions of the introductions). The introduction to volume 1 also describes how the material was keypunched and then converted to computer tapes readable on an IBM 360/30 mainframe.

### **Creating the Digitized Dataset**

Copies of the six volumes of ICBS reports were scanned to PDF files at the Harvard University Library. Then the process involved several additional stages.

- 1) I exploited a sophisticated optical character recognition (OCR) program, OmniPage Professional 17. The OCR program operated on each page of the scanned PDF images in order to create the first draft of the digitized Excel tables. In order to maximize the program’s accuracy of recognition, only table cells were put through the OCR process; thus the program only had to recognize numerals. Row and column headings and table titles were manually entered later. The OCR program’s capabilities were impressive; thus it focused on designated parts of a given page, treated the material therein as a table of numbers arranged in rows and columns, ‘learned’ from corrections, and converted the recognized material into Excel output. Nevertheless the challenges to the program were also impressive: the faded

- numbers, the rows and columns that were not quite straight on the page (and hence could not be correctly interpreted as cell entries of a given row), etc.
- 2) After exploiting the OCR program as fully as I could, I turned the material over to two Bard undergraduate research assistants who compared the OCR results in the Excel draft tables against the PDF page images. The first task was to be sure that the structure of the table was correct: that all rows and columns were included. The second task was to add the row and column headings table title. Then the RAs faced the difficult task of checking the digitized cell entries against the cell entries in the PDF image. A high proportion of the tables involved row and/or column totals. In these cases the RAs could exploit the Excel 'sum' function in order to recalculate totals and compare those to the totals found in the PDF for the original printed table. When they differed the entries that made up the total were checked one by one.
  - 3) Finally, the work of the two RAs was rechecked. First, two of the Levy Institute support staff compared the Excel tables to the PDF images in all six volumes. And finally, Bard student volunteers undertook an independent check of the RAs work in two of the volumes. By this last stage, the number of errors caught was very slight (and the errors were never systematic). Indeed, corrections to the original printed materials were of comparable frequency to those caught in the newly digitized version.

### Table Notes

Markers referring to notes at the end of tables are found throughout the digitized tables. Each such marker is placed *in a separate narrow cell* to the right of the cell entry so marked. Had we left the marker in the same cell as the census result to which it refers, one of the major advantages of Excel would have been lost to the user: the ability to manipulate cells of the worksheet for calculations.

Markers for three *types of notes* appear in the digitized tables.

- 1) All table notes found in the original publications were copied. These were typically indicated by roman lowercase letters (e.g., a-f) and those have been preserved.
- 2) Errors found in the original are indicated by an x followed by a numeral (x1, x2, x3, etc.).
- 3) The ICBS introductions warned readers that “For lack of time, exact estimates of sampling errors have not yet been drawn up. Only very rough estimates were made to caution the reader in respect of estimates for which the sampling error might be considerable” (e.g., ICBS, 1967–70, Vol. 3, p. xxviii). In the published volumes, one or two sets of parentheses around the cell entry identify results subject to “high” and “very high” sampling error, respectively. In the digitized version, the note marker appears in a narrow adjacent cell, to the right of the cell entry. Cell entries subject to high and very high sampling error are marked by one and two asterisks, respectively.<sup>1</sup>

The introductions to volumes 2–6 note further that cells without any special designation had a relative standard error—i.e., [standard error for the cell entry] / [cell entry]—below 30 percent. The criterion for distinguishing between the dangers of “high” and “very high” sampling error are given in volumes 3 and 6 as a relative standard error of 50 percent. For volumes 2 and 4, the situation is more complicated: no such criterion is printed. Instead, the discussion concerns the sample size of the denominator.<sup>2</sup> Users interested in pursuing these issues in detail should

---

<sup>1</sup> In the original, the explanation for the meaning of the warnings appears only in the introduction rather than in each table. For clarity’s sake, in the digitized tables the asterisks are treated as note markers for which the note appears at the end of every relevant table. In the note, the words in quotes, “subject to high [or very high] sampling error,” are copied from the ICBS introductions.

<sup>2</sup> In volume 5 the introduction simply refers to the introductions to volumes 2 and 3. But these two volumes differ as to the criterion for the difference between high and very high sampling error so that it is not clear which to follow for cell entries in volume 5. The reason for the difference in criterion between volumes 2 (and 4) and 3 (and 6) apparently has to do both with the complexity of the sampling design as it relates to the specific variables in relevant tables (including but not limited to whether the cell entry refers to households or persons). See especially the following pages of the introductions: volume 2, pp. xxviii–xxix; volume 3, p. xviii; volume 4, p. xxiv; volume 5, p. xiii; and volume 6, p. xxxiv. In each case, guidelines for confidence intervals immediately follow.

also notice the guidelines for calculating confidence intervals found in each volume.

### **The Geographic Area to Which the Table Refers**

Most text tables in volumes 1–5 cover either the population in the West Bank or the population in the Gaza Strip. In the published version of volumes 1–5, only general headings inserted into the table of contents guide the reader to the fact that (for example) in volume 1, tables 2–5 and 6–9, cover the West Bank and Gaza Strip, respectively (while table 1 covers all the occupied territories). The table of contents to the digitized version preserves this information. However, to minimize confusion and the need for cross checking, each table indicates if the table refers to the West Bank or Gaza Strip only (directly below the volume and table number).

Volume 1 of the printed volumes appeared in 1967; it referred throughout to the “West Bank.” By contrast, the other volumes, which appeared between 1968 and 1970, referred to the area as “Judea and Samaria.” The Levy Institute’s digitized version uses only the former designation when inserting information on location. However, direct quotations (in the table titles or in row or column headings) were copied as found. Similarly, all six census volumes distinguish between The West Bank and the area defined by the municipality of East Jerusalem; the digitized version does likewise.<sup>3</sup>

### **Other Census Datasets: Digitized Tables vs. Public-use Samples**

As already mentioned, there have been three machine-readable censuses for the West Bank and Gaza Strip from which detailed information is available: the 1967, 1997, and 2007 censuses – the first undertaken by the Israelis, the latter two by the Palestinian Authority. Tables from the latter two enumerations are available on the website of PCBS.<sup>4</sup>

Users should also appreciate the distinction between digitized *tables* and a digitized *individual-level dataset* made available to researchers. The former is a collection of tables like those published in a census report but now entered into a convenient format such as Microsoft

---

<sup>3</sup> The Israeli government in the years 1967–70, when the census was conducted and the six report volumes published, had not formally annexed East Jerusalem. Nevertheless, it had defined municipal boundaries for that area, and created an administrative coordination between East and West Jerusalem.

<sup>4</sup> There have also been a number of other surveys of the population, most notably by the Norwegian research group FAFO. See in particular Heiberg and Øvensen (1993).

Excel for easy manipulation by the user. The latter is *not* a report aggregating information; rather, it comprises the unaggregated responses that each individual in a representative sample of census respondents provided to each question. Since the samples are selected so as to include all members of households, information on household structure and well-being – even on the dwellings in which the households live – is also a staple of these datasets. Such datasets are commonly referred to as *census public-use samples*.

The size of these census public-use samples outstrips anything the social scientist is familiar with from other contexts; typically they include 1–5 percent of the people in large countries such as the United States and as much as 20 percent of the people in smaller countries, such as Israel or the Palestinian territories. For the intensive study of national populations – whether at one moment in time or across decades – these public-use datasets have proven invaluable.

The great value of the public-use census samples is found in the fact that the information has not been aggregated in any way; by contrast in census publications it always has been aggregated. Relying on the public-use census samples, researchers are free to explore any question they like, so long as the census asked a relevant question. No longer are inquiries limited to the tables selected by census officials – who are constrained by budgets, by the need to cover a little of everything, and (often enough) by some political sensitivities. Likewise researchers using public-use datasets need not limit attention to a variable's broadest categories (so often found in published tables); instead they may study a variable at its narrowest, most refined, level (e.g., geographic place, educational attainment, occupational distribution, fertility, etc). And crucially, researchers may choose to control for many variables at once (while exploiting refined categories of those variables) in an effort to understand outcomes with multivariate statistical techniques. Thus, fertility decline in city vs. village may be compared while controlling for the age, education, and religion of the mother and the father separately as well as for the household economic level and region of the country.

Public-use samples for the 1997 and 2007 PCBS censuses are available from the PCBS typically for a fee; these include 20 percent of the enumerated population (PCBS 2008). A version including 10 percent of the population is available free online at the University of Minnesota Population Center's project, IPUMS International, which archives such data from scores of countries (MPC 2011). Public-use samples are available for Israeli population censuses as well; these include residents of the State (Jews and Arabs) and Jewish residents on

settlements in the occupied territories (the public-use samples for the Israeli population censuses are also available from IPUMS International). However, the public-use sample for the census that is our subject here – the 1967 census of the West Bank, Gaza Strip, and East Jerusalem – is not as easily accessible. The ICBS recently recovered the computer tape, first produced for internal use in the 1960s, and prepared a version for computers of our own day. However, in most if not all countries, not all datasets are released to researchers without restrictions. The ICBS limits applicants to some datasets to researchers working in Israel who also have an affiliation with an institution of higher education there (ICBS 2011). Access to the public-use sample from the 1967 census is so limited.<sup>5</sup>

Users should therefore be aware that the actual dataset from which tables were first constructed has not been lost; it is to be hoped that in the future it will be made available to all. In the meantime, the value of the digitized tables on the Levy Institute website will be all the greater because it allows researchers to learn a great deal and sharpen the questions they would address to the public-use sample. Likewise, even those who can work with the public-use sample today are likely to find that first exploring the potential of the digitized tables will save them time and improve their own use of the public-use sample.

## **Acknowledgments**

Bard student volunteers contributed more than 130 hours of work, part at an early stage, experimenting with methods of data entry, and part at the end in checking results; thanks to all and especially to Mujahed Sarsur who organized the volunteers. Wendy Thomas at the University of Minnesota Population Center kindly shared her knowledge of OCR programs and ran preliminary tests that allowed us to determine a viable strategy for the workflow. A subsidy from the Bard College President Leon Botstein enabled the hiring of the two careful research assistants (Liudmila Malyshava and Maya Perlmann). The Levy Institute contributed my own time and that of staff members Kathleen Mullaly and Jeannie Lam, who proofread tables; Barbara Ross, who copyedited everything else; Marie-Celeste Edwards, who brought the material onto the website; and Susan Howard, the Institute's administrator, who facilitated

---

<sup>5</sup> Personal correspondence with the ICBS. I am grateful to both Shlomo Yitzhaki, who heads the ICBS, and Ari Paltiel for their patient replies to many queries. And I am gratified that my own formal and informal inquiries throughout the relevant Israeli bureaucracy and archives helped lead to the rediscovery of the relevant computer tape.

every stage. Finally, I am grateful to Levy Institute President Dimitri B. Papadimitriou, who recognized the value of the effort and supported it throughout.

### **Suggested Citation for Material Taken from This Site**

For *tabular data*, the citation should include the volume and table number. For *the PDFs of the introductions* to the original reports, the citation should include the volume number and page(s) cited. For the *Dataset Documentation* the citation should include "Dataset Documentation." In all three cases, the rest of the citation should be:

  Census of Population 1967

WEST BANK OF THE JORDAN  
GAZA STRIP AND NORTHERN SINAI  
GOLAN HEIGHTS

Data from Full Enumeration

Jerusalem, 1967

## P R E F A C E

The Central Bureau of Statistics takes pleasure in presenting the public with the first publication of the Special Series of the Census of Population 1967.

This Census was carried out in accordance with a decision of the Interministerial Committee for the Interior and Public Services of 11. VII 1967 for the Israel Defence Forces. The regions enumerated were the Golan Heights, the Gaza Strip, North Sinai and the West Bank of the Jordan.

This publication supplies the reader with statistical data on the composition of the population according to sex, age, religion and birthplace of the family head in detailed geographic units. These results were obtained by a full enumeration of the population present in the administered territories.

The Introduction to this volume presents: main findings, description of the census procedures, time-table, explanations of results and maps.

In future volumes the reader will be presented with the results of the questions posed in the sample (20 per cent of the enumeration districts). These volumes will deal with the following subjects: detailed demographic characteristics, migration, fertility, infant deaths, level of education, employment, unemployment and housing conditions. The planning of the Census was carried out, contrary to the usual practice, in an extremely short time. There is no doubt that the co-operation of institutions and Government offices contributed toward the success of the Census, and I thank every one for his co-operation. Special thanks are due to the Headquarters of the Israel Defence Forces for their assistance.

Attached is a list of the senior staff who took part in the Census which also includes the senior staff of the enumeration blocs. In the carrying out of the Census thousands of temporary workers were also employed for this one-time job. It is my pleasant duty to thank all employees who took part in the planning and the execution of the enumeration, the processing and publication of the material. Only the great efforts of the senior team during the period of preparations for the census and while it was carried out, made the accomplishing of this difficult task possible.

Prof. R. Bachi  
The Government Statistician

# INTRODUCTION

## MAIN FINDINGS

### Size and Geographic Distribution of the Population

In the West Bank 598,637, in the Gaza Strip 356,261, in North Sinai 33,441 and 6,396 persons were counted in the Golan Heights- a total of 994,735 in all areas.

In the West Bank the largest population - over 100,000 each - was found in the districts of Nablus and of Hebron, but population density was highest in the Tulkarm district with 218 persons per sq.km. In the remaining districts the density varied from 88 to 137 persons per sq km, except in the Jericho district whose population was particularly affected by departures due to the recent war (Table A).

TABLE A.- POPULATION, AREA AND POPULATION DENSITY IN THE WEST BANK, BY DISTRICT

| D i s t r i c t | Population          |             | Area<br>(Sq.Km.) | Density<br>per<br>Sq. Km. |
|-----------------|---------------------|-------------|------------------|---------------------------|
|                 | Absolute<br>Numbers | Percentages |                  |                           |
| Total           | 598,637             | 100.0       | 5,505.0          | 108.7                     |
| Hebron          | 118,358             | 19.7        | 1,056.2          | 112.1                     |
| Bethlehem       | 49,515              | 8.3         | 565.2            | 87.5                      |
| Jerusalem       | 29,904              | 5.0         | 284.1            | 105.3                     |
| Jericho         | 9,078               | 1.5         | 338.1            | 26.9                      |
| Ramallah        | 88,877              | 14.8        | 770.3            | 114.9                     |
| Nablus          | 152,381             | 25.5        | 1,587.4          | 96.0                      |
| Tulkarm         | 72,229              | 12.1        | 332.0            | 217.6                     |
| Jenin           | 78,295              | 13.1        | 571.7            | 137.0                     |

In the Gaza Strip, with an average population density of 973 persons per sq.km., close to half the population was found in the Northern part, around Gaza and Jabaliya.

Further particulars on the distribution of the population over the census area may be found in the maps included in this publication.

### Types of Settlement

Most of the West Bank is rural, a characteristic still further intensified after East Jerusalem has been unified with the Israeli part of the city. In September, 1967, only 29 per cent of the inhabitants lived in urban settlements, including the respective refugee camps; excluding these camps, only 26 per cent of the population were urban.

In the Gaza Strip, on the other hand, the population is highly urbanized: 92 per cent of all inhabitants live in urban settlements or in large refugee camps.

It was found that 13 per cent of the West Bank population and 48 per cent of the Gaza Strip population live in refugee camps whether in or outside urban settlements.

The number of nomads was found to be small, mainly because of the definition used in the census but partly also because of the inaccessibility of some of the areas where they roam (see chapters on Definitions and Limitations). Also according to the 1961 Census of the Kingdom of Jordan, the number of nomads in the West Bank was not considerable.

TABLE B.- POPULATION OF WEST BANK AND GAZA STRIP,  
BY TYPE OF SETTLEMENT

|                                         | West Bank        |             | Gaza Strip       |             |
|-----------------------------------------|------------------|-------------|------------------|-------------|
|                                         | Absolute Numbers | Percentages | Absolute Numbers | Percentages |
| TOTAL                                   | 598,637          | 100.0       | 356,261          | 100.0       |
| Urban settlements - total               | 174,452          | 29.0        | 282,803          | 79.4        |
| Excluding refugee camps                 | 155,235          | 25.9        | 149,489          | 42.1        |
| Refugee camps in urban settlements      | 19,217           | 3.2         | 133,314          | 37.3        |
| Refugee camps outside urban settlements | 37,221           | 6.2         | 39,207           | 11.0        |
| Large villages                          | 41,697           | 7.0         | 7,561            | 2.1         |
| Small villages                          | 337,531          | 56.4        | 23,807           | 6.7         |
| Nomads                                  | 1,888            | 0.3         | 1,105            | 0.3         |
| Living outside settlements              | 5,848            | 1.0         | 1,778            | 0.5         |

About 90 per cent of the population enumerated in North Sinai lived in the town of El Arish.

Villages are the only populated settlements in the Golan Heights.

The following breakdown of the West Bank population by district and principal type of settlement shows that urban settlements played a greater role in the southern part of the area. This was even more pronounced when East Jerusalem still belonged administratively to the West Bank.

TABLE C.- WEST BANK POPULATION, BY DISTRICT AND PRINCIPAL TYPE OF SETTLEMENT (Percentages)

| D i s t r i c t | Total | Urban<br>Settlements<br>(Excl. Refugee<br>Camps) | All<br>Refugee<br>Camps | Rural<br>Settlements |
|-----------------|-------|--------------------------------------------------|-------------------------|----------------------|
| Hebron          | 100.0 | 32.4                                             | 5.0                     | 62.6                 |
| Bethlehem       | 100.0 | 52.2(a)                                          | 12.2                    | 35.6                 |
| Jerusalem       | 100.0 | -                                                | 18.1                    | 81.9                 |
| Jericho         | 100.0 | 58.5                                             | 31.8                    | 9.7                  |
| Ramallah        | 100.0 | 24.6                                             | 7.2                     | 68.2                 |
| Nablus          | 100.0 | 27.4                                             | 11.3                    | 61.3                 |
| Tulkarm         | 100.0 | 26.5                                             | 10.5                    | 63.0                 |
| Jenin           | 100.0 | 10.7                                             | 6.4                     | 82.9                 |

(a) Including Beit Sahur.

### Religion

Moslems are the overwhelming majority in the West Bank (95 per cent) the Gaza Strip (99 per cent) and North Sinai (99 per cent). On the other hand there is a great majority of Druzes in the Golan Heights (included in Tables 11 and 12 under "others"). Further particulars on the religious distribution in the West Bank and the Gaza Strip are given in the following table.

TABLE D.- POPULATION OF THE WEST BANK AND GAZA STRIP,  
BY RELIGION

| R e l i g i o n                   | West Bank | Gaza Strip |
|-----------------------------------|-----------|------------|

(a) Including 139 Samaritans in the Nablus district.

There are two groupings of urban settlements with a high proportion of Christians in the West Bank:

|                                          | Christians per 100 Inhabitants<br>of Known Religion |
|------------------------------------------|-----------------------------------------------------|
| Bethlehem, Beit Jala, Beit Sahur - total | 52.8%                                               |
| Bethlehem                                | 40.1                                                |
| Beit Jala                                | 71.6                                                |
| Beit Sahur                               | 69.5                                                |
| Ramallah, Bira - total                   | 29.6                                                |
| Ramallah                                 | 59.4                                                |
| Bira                                     | 2.6                                                 |

Another four villages in the West Bank have a Christian majority, three in the Ramallah and one in the Jenin district.

## Age Distribution

Children of the 0-14 age group constitute a striking proportion of the population in all the areas considered (47 to 51 per cent). Only 34-39 per cent were found to belong to the medium age group (15-44) while the older age groups (45 and above) accounted for 14 to 19 per cent of the population (see Table E). Accordingly, compared with the Jews of Israel, these are much younger populations with a very high percentage of children, in line with the much higher birth rate. The age structure comes much closer to that of the Non-Jewish residents of Israel, especially the Moslem population, though certain differences must still be noted. The 0-14 and the 15-29 age groups in the administered territories show somewhat lower percentages, while the 30-45 old ones, and especially the age groups above 45, make up a relatively higher proportion of the population. Infant mortality, which is greater than among the Non-Jews in Israel, is probably responsible for the lower proportion of children aged 0-14, while the smaller proportion of the 15-29 age group, particularly in the West Bank, is probably due to the fact that many young people left before and after the War; this applies particularly to young men (see section on Sex below). It should be possible to assess in greater detail the emigration from these territories after additional results of the Census have become available and a comparison can be made with earlier data.

TABLE E.- POPULATION OF THE ADMINISTERED TERRITORIES, BY AGE  
(Percentages)

| A r e a          | Total | 0-14 | 15-29 | 30-44 | 45-64 | 65+ |
|------------------|-------|------|-------|-------|-------|-----|
| West Bank        | 100.0 | 48.4 | 20.2  | 13.9  | 10.9  | 6.6 |
| Gaza Strip       | 100.0 | 50.6 | 21.4  | 14.2  | 9.0   | 4.8 |
| North Sinai      | 100.0 | 47.6 | 22.2  | 16.6  | 9.6   | 4.0 |
| Golan Heights    | 100.0 | 46.8 | 20.8  | 13.7  | 12.1  | 6.6 |
| Israel, 1966     |       |      |       |       |       |     |
| Non-Jews, total  | 100.0 | 50.4 | 23.7  | 13.4  | 8.4   | 4.1 |
| Thereof: Moslems | 100.0 | 53.1 | 23.5  | 12.3  | 7.4   | 3.7 |
| Jews             | 100.0 | 31.6 | 24.5  | 17.7  | 19.7  | 6.5 |

In most districts of the West Bank the percentage of children was lower in urban than in rural settlements. On the other hand, the proportion of young people aged 15-29, and sometimes also of the 30-44 age group, was lower in the rural settlements, indicating a higher rate of emigration from the villages for persons in these ages. This conjecture seems confirmed by the higher percentage of old people found in rural than in urban settlements. A particularly high proportion of children was found in the refugee camps and in the southern part of the West Bank (the Hebron district and the villages of the Bethlehem district). On the other hand, among the Christians the proportion of children was relatively low (38 per cent). As in the West Bank, the refugee camps in the Gaza Strip also showed a particularly high percentage of children (Table 1).

### Sex

In the administered territories a strikingly low percentage of men was found in the age groups 15-29 and 30-44 (see Tables F and 1; Table F presents comparative figures for Israel). In most districts of the West Bank the deficiency of young men is particularly acute in the villages. The low proportion of young men seems to be due, in the first place, to the long-continued operation of a tendency to emigrate from country to town, from the West to the East Bank and from the administered territories to other countries - as well as to the departures of men of this age group owing to the recent war.

### Size of Households

In view of the high fertility of the population, the average number of persons per household is very great. This average, which is also affected by the families' living habits and by differential emigration rates, was particularly high in the Gaza Strip (5.8) and North Sinai (5.4). In the West Bank the average was 4.9 with slight variations according to the type of settlement and district. The same average of 4.9 was also found in the Golan Heights (Table 1).

### Origin from Israel Territory

To ascertain the scope of the 1948 war refugee problem the following data were collected.

1. Information on the locality of birth of the head of the household.
2. From the geographical angle, data on the inhabitants of the refugee camps including those situated within the urban settlements.

TABLE F.- MALES PER 1,000 FEMALES IN THE ADMINISTERED  
TERRITORIES AND IN ISRAEL

| Territory                                      | Total of<br>Known Age | 0-14  | 15-29 | 30-44 | 45-64 | 65+   |

| ISRAEL, 1966                                   |                       |       |       |       |       |       |
| Non-Jews - total                               | 1,051                 | 1,083 | 1,102 | 976   | 903   | 978   |
| Thereof: Moslems                               | 1,061                 | 1,076 | 1,118 | 998   | 921   | 1,016 |
| Jews                                           | 1,017                 | 1,053 | 1,053 | 922   | 1,032 | 944   |

Information on items 1) and 2) was obtained in the full enumeration while the data listed under 3) were obtained from a 20 per cent sample (and will appear in the coming publications of the 1967 Census).

According to the locality of birth of the household head it could be determined whether this place lay outside or within the territory of the State of Israel (as it extended before the Six-Days War). All household members could accordingly be classified into two origin groups. Clear information on this point was obtained for 96 to 97 per cent of household heads in the West Bank and the Gaza Strip; the remaining 3 to 4 per cent are largely accounted for by the fact that all persons born in Jerusalem were classified under "unknown" (see Definitions". Already now it may be stated that a high degree of correspondence is found between the division of the adults into the two origin groups, whether this division is made according to the place of birth of the household head (full enumeration) or the place of residence of each person before the 1948 war (sample).

From the full enumeration it appears that of the 598,600 inhabitants of the West Bank 468,000 were from outside Israel territory and 105,700 came from this territory, while the origin of 24,900 is unknown. Of the 356,300 inhabitants of the Gaza Strip 134,600 were from outside Israel territory and 207,300 came from Israel territory, with 14,400 unknown. Considering only those whose origin could be determined, 18 per cent of the West Bank population were found to belong to families originally living in Israel territory, as against 61 per cent in the Gaza Strip.

The percentage of persons originating from Israel territory was much higher in the refugee camps than among the rest of the population. This group made up 85 and 91 per cent respectively of the refugee camp population (including camps situated within urban settlements) in the West Bank and in the Gaza Strip, compared with only 12 and 29 per cent, respectively, among the population of known origin not living in camps. The figures, incidentally, show that part of the camp population does not belong to this origin group.

Table G show the population in the urban settlements of the West Bank and the Gaza Strip broken down by residence outside or in refugee camps and by origin from Israel territory.

On the basis of the findings from the sample as well as from the full enumeration, a more detailed comparison will be possible with the UNRWA figures on the refugee population. Even now it can already be pointed out that UNRWA's figures are by far larger than the total number of persons in households whose heads indicated in the census, that they were born within Israeli territory. Furthermore, the UNRWA figures for registered

TABLE G.- URBAN POPULATION OF WEST BANK AND GAZA STRIP,  
BY REFUGEE CAMP RESIDENCE AND ORIGIN (Percentages)

| Name of Settlement | Total | Outside Refugee Camps          |                     | In Refugee Camps               |                     |

| Qalqiliya          | 100.0 | -                              | -                   | 78.8                           | 21.2                |
| Jenin              | 100.0 | 2.8                            | 34.9                | 43.1                           | 19.2                |

refugees in camps are larger than the total camp population enumerated in the Census. The following comparison is based for the West Bank on UNRWA figures after the Six Days War, i.e. only a few weeks before the Census. Although for the Gaza Strip only somewhat earlier UNRWA figures were available the volume of departures is known to have been rather limited there during the period between the war and the Census.

The census also provides information on the population in households whose head was born in the present locality of residence. Their share in the total population (with the exception of the Israeli origin group) is very high: 91.2 per cent in the West Bank and 87.6 per cent in the Gaza Strip and North Sinai. The percentages were even higher in rural settlements -

92.4 and 91.4 per cent, respectively, in rural settlements as against 85.4 and 87.6 per cent, respectively, in urban settlements.

(a) Not including cases where the origin of the household head was not known (see Table 1).

#### Size of Population Compared with Previous Data

While according to the present Census the population of the West Bank was 599,000, the population according to the 1961 Census of the Kingdom of Jordan was about 730,000 in the same area (i.e. excluding East Jerusalem). Close to 6 years elapsed between the two censuses. No comprehensive picture has yet been obtained of the development of the West Bank population during this period. On the one hand it is known that the natural

increase was considerable. On the other hand there were the departures as a result of the Six Days War. It should, however, be stressed that even before that war there was a strong tendency of emigration from the West Bank, either to the East Bank or to other countries. In fact the West Bank population grew by only 53,000, or at an annual rate of merely 0.9 per cent, between the Jordanian Censuses of 1952 and 1961, which is much less than the growth to be expected from natural increase. Moreover in the 1961 Census the population of the West Bank reported 50,262 family members staying abroad, mainly in oil-producing countries, and this was no more than a partial count of emigrants. The factors of development of the West Bank population are now under study. The data obtained from the 20 per cent sample of the 1967 Census on various aspects of mortality and emigration will be of assistance in elucidating the components of population change in the West Bank.

As regards the geographical distribution of the West Bank population, there is a great deal of agreement between the 1961 and 1967 Censuses. The only strong exception is the Jericho district from which the departures connected with the Six Days War were particularly numerous.

TABLE I.- WEST BANK POPULATION ACCORDING TO 1967 CENSUS AND  
JORDANIAN 1961 CENSUS

| Districts and Principal Localities  | 1967<br>Census | 1961 Jordanian<br>Census |
|-------------------------------------|----------------|--------------------------|
| TOTAL                               | 598,637        | 729,804                  |
| Hebron district                     | 118,358        | 117,768                  |
| Hebron                              | 38,348         | 37,868                   |
| Bethlehem district                  | 49,515         | 54,777                   |
| Bethlehem(a), Beit Jala, Beit Sahur | 31,885         | 35,735                   |
| Jerusalem district (b)              | 29,904         | 31,302                   |
| Jericho district                    | 9,078          | 63,980                   |
| Jericho                             | 6,829          | 10,166                   |
| Ramallah district                   | 88,877         | 118,839                  |
| Ramallah and Bira                   | 25,171         | 29,269                   |
| Nablus district                     | 152,381        | 170,452                  |
| Nablus                              | 44,223         | 45,768                   |
| Tulkarm district                    | 72,229         | 83,600                   |
| Tulkarm                             | 15,275         | 20,690                   |
| Qalqiliya                           | 8,926          | 14,401                   |
| Jenin district                      | 78,295         | 79,139                   |
| Jenin                               | 13,365         | 14,402                   |
| Nomads                              | (c)            | 14,947                   |

(a) Incl. the Dahisha refugee camp. (b) Excl. East Jerusalem.

(c) Included in district population.

In the Gaza Strip (excluding North Sinai) the Statistical Section of the Egyptian Administration used to prepare annual population estimates. The published estimate for 1965 set the figure at 427,910. The 1966 estimate, which was about to be published when the Six Days War broke out, came to 454,960. On the other hand the 1967 Census showed the actual figure to be 354,000 (excluding some 2,500 persons in the southern part of Rafah, which is situated in North Sinai), viz. some 100,000 or 22 per cent less than according to the Egyptian estimate for 1966. Only few inhabitants of the Gaza Strip had left the area by the time the Census was taken on 10-14 September, 1967. Most of the difference is therefore due to systematic errors in drawing up the annual estimates; for instance, greatly exaggerated figures of natural increase were used in the preparation of these estimates because of the defective registration of deaths.

Despite the considerable differences in the magnitude of the figures, the geographical distribution of the population according to the 1967 Census and the Egyptian estimates is largely similar:

TABLE J.- GAZA STRIP POPULATION ACCORDING TO 1967 CENSUS  
AND EGYPTIAN ESTIMATE FOR 1966

| Principal Localities | 1967<br>Census | Egyptian Estimate<br>for 1966 |
|----------------------|----------------|-------------------------------|
| TOTAL                | 356,261(a)     | 454,960                       |
| Gaza                 | 118,272        | 152,776                       |
| Jabalia              | 43,604         | 49,009                        |
| Deir el Balah        | 18,118(b)      | 15,002                        |
| Bureig camp          | 12,786         | 14,204                        |
| Nuseirat camp        | 17,638         | 20,416                        |
| Khan Yunis           | 52,997         | 75,100                        |
| Rafah                | 49,812(a)      | 66,181                        |

(a) Including the southern part of Rafah (about 2,500 inhabitants).

(b) The excess over the Egyptian estimate is probably due to differences in the area attributed to the locality.

No data from recent years are available on the population of North Sinai, which at the time of the Census was 33,441, excluding nomads. Of the Egyptian Census conducted in 1960 only the global figure for the whole of Sinai was published, amounting to 49,769.

## ORGANIZATION AND PROCEDURES OF THE CENSUS

### 1. The Purposes of the Census

In accordance with the decision of 11 VII 1967 of the Interministerial Committee for the Interior and Services, i.e. one month after the Six Days War, the Central Bureau of Statistics was requested to carry out a Census of Population in the areas administered by the Israel Defence Forces for their Headquarters.

The census was intended:

- a. to enumerate the inhabitants by localities and to supply basic demographic data on each locality and region with particular attention to refugee camps;
- b. to supply detailed data on the demographic characteristics, education, labour force characteristics, housing conditions, etc., of the population of these areas, distinguishing the refugees from the 1948 War;
- c. to supply each family head with a document certifying his presence at the time of the census and which could serve him for identification purposes in all his dealings with the authorities;
- d. to prepare a basis for a Population Register, if one should be required.

The Israel Defence Forces Headquarters needed the statistical information in order to restore life to normal in the administered territories and in order to enable the planning of the public and local services - e.g., education and health. The previous statistical data on these areas could not be used because of deficiencies in the statistics, especially as to the refugees and because of the changes brought about by the Six Days War.

### 2. The Organization and Time Table of the Census

Upon assignment of the task a special "Census Headquarters"(a) was

- (a) which was composed of the Director of the Department of Statistical Methods, the Directress of the Surveys Department and the Chief for the Statistics of the Minorities. At a later stage the Co-ordinator of the Economic Statistics joined the H.Q. A detailed list of the staff responsible for the census is given on page

set up, in the C.B.S., which together with the Directorate of the Bureau and the professional and executive units started the planning of the census procedures and the other necessary preparations. These preparations were made in co-ordination with the Israel Defence Forces, the Ministry of the Interior and other relevant Ministries. The results of the Census were required urgently and the field-work had to be completed before the rainy season and the Festivals, and it was therefore necessary to complete all the preparations in two months, whereas several years are usually required to prepare a census.

The size of the territories, the relatively large distances and the population of about a million people to be enumerated made it necessary to divide the territories into eight Enumeration Regions:

- (1) the Golan Heights - enumerated on August 15th (the census of the Golan Heights served as a rehearsal for the procedures and organization of the census in the other territories);
- (2) the Gaza Strip and Northern Sinai (3 regions) - enumerated on September 10th, 12th and 14th (there was no request to carry out a census in Southern Sinai because of the small population and the large distances);
- (3) the West Bank of the Jordan (4 regions) - enumerated on September 17th, 19th, 21st and 25th. The enumeration in the Bethlehem-Hebron region was carried out on Monday 25 IX instead of Sunday, so as not to disturb the Christian services.

A detailed time-table is presented on page XXVIII.

On September 27th the C.B.S. carried out a Census of Population and Housing of Eastern Jerusalem (the results of this census will be published separately).

### 3. Mapping

For efficient field-work, which would ensure the orientation of enumerators and their supervisors in their enumeration areas and the approaches to them and which would make enumeration full and avoid duplication, a special team was set up (under the supervision of the Bureau's Geography Unit) whose task it was to provide maps for all areas to be enumerated. Since no detailed maps were available for most of the areas, air-photos were used. These were checked by a team of mappers who reconnoitred the areas and set down the boundaries of the enumeration districts according to an estimate of the number of households (50-70 per district). Difficulties in approach and distances were also considered. The total number of such districts amounted to about 3,500. Maps were

prepared for all enumeration districts, sections, sub-groups, groups and sub-regions.

#### 4. The Questionnaire

The census served to provide identity documents for the population and the basis for a Population Register. This made it necessary to fill in a separate questionnaire for every "nuclear family unit" - comprising a man, his wife (or wives) and their unmarried children, so that sometimes a number of questionnaires were filled in for the different units in the same "household". In the full enumeration the following basic questions were asked:

- a. for the head of the unit, the full name, his address, sex and marital status, religion, age, locality of birth, profession and number of identity card or passport;
- b. for other members of the unit - name, sex, marital status and age.

In institutions (see Definitions) questionnaires were filled in for each person.

Questionnaire A is presented on p. XXXVII ; it was filled in by the enumerator in three copies (with a common serial number):

- a. the original which was used for coding, punching and statistical tabulations;
- b. a complete copy, which was separated in the office, intended as the basis for a Population Register;
- c. a slip handed to the head of the unit to certify his enumeration and to serve as an identity document in his dealings with the authorities.

The detailed demographic characteristics (place of residence in 1948, fertility of the women, and infant deaths), as to education, labour force characteristics (economic branch, present occupation and occupation before the war, etc.), housing and living conditions of the household were studied in a sample of 20 per cent of the households(a).

- 
- (a) On the Golan Heights the entire population was asked these questions about a week after the full enumeration, together with the handing-out of identity cards on behalf of the Israel Defence Forces.

## 5. Census Procedures

In order to ensure maximum coverage of the population, it was decided to carry out the enumeration from house to house under curfew (one day in each region) and to record the persons present in each household (or institution), i.e. on a "de facto" basis. Special permits were given to inhabitants whose occupations required them to work outside their homes during the curfew hours (physicians, nurses, policemen, etc.), and they were enumerated at their home addresses on the basis of a special questionnaire filled in when the permit was issued. The enumerator marked the doors of the houses enumerated with chalk to ensure an orderly and complete coverage of each enumeration district.

It was decided to select in advance a stratified representative sample of 20 per cent of the enumeration districts. In these districts the enumerator filled in a "Stage B" questionnaire with the detailed questions for every household and every adult (15 years and over), after having filled in the "Stage A" questionnaire for all the units in the household (these questions were not asked of nomadic Bedouin), this procedure ensured collection of all the data in an Enumeration Region on one census day, which saved expenses and inconveniencing the inhabitants; it also made possible speed in processing. On the other hand the sample errors are larger (due to the comparatively large clusters) than in a systematic sample of households (as operated in the Israel Census of Population and Housing 1961). The results obtained from the sample questions will be published in continuation of this series of publications with a detailed description of the procedures.

## 6. Organization of the Enumeration

The C.B.S. appointed a superintendent and assistant in every region to prepare for the enumeration; on the day of the enumeration they worked in co-operation with the Statistics Liaison Officers to the Israel Defence Forces Headquarters for the region.

For each "Stage A" Enumeration District (which was not selected for the "Stage B" sample) 3-5 Arabic speaking enumerators were needed, in accordance with the size of the enumeration district (as estimated prior to the enumeration) and the difficulties of approach to the Enumeration Districts and the walking distances from house to house. A crew-leader (Stage A) was appointed to each 2-3 Enumeration Districts.

The crew-leaders studied the boundaries of the Enumeration District in his "section" on the day of preparation (which was held the day before

the enumeration in a region), so that he could introduce his teams of enumerators into their Enumeration Districts according to a specific enumeration path and could supervise their work.

For the Stage B Enumeration Districts (which were selected for the sample) 6-10 Stage B enumerators were needed: the many questions took a much longer time than the basic questions in the Stage A questionnaire. Each Stage B Enumeration District constituted a section to which a Stage B crew-leader was appointed, in order to supervise the work of the enumerators in covering the Enumeration District and completing the two types of questionnaires.

Three adjacent sections usually constituted a sub-group for which a chief was responsible who was assisted by an editor who checked the material and arranged it. Supervisors were appointed to each group (which was usually composed of four sub-groups in order to supervise the chief's work and the reporting of progress during the day of enumeration and to transfer man-power if required. Five sub-regional supervisors assisted in supervising the work of the entire field team, as located to each enumeration region, under the direction of the regional superintendent and his assistant.

The senior field staff (crew-leaders and above) were recruited and trained in advance primarily by C.B.S. staff. About 3,000 Arabic-speaking(a) enumerators were recruited during the month preceeding the census from all parts of Israel. They were interviewed and tested: the test enabled the selection of the better qualified as Stage B enumerators or crew-leaders. Stage A enumerators were trained for half a day while Stage B enumerators received one and a half days' training.

The number of enumerators and crew-leaders required differed from region to region; which increased the organizational difficulties. The C.B.S. organized pick-up routes with special buses for the enumerators and the other workers: the journey from their homes to the region took up to 4 hours. A temporary "matching and despatching" station was set up in each enumeration region in order to collect the senior staff (crew-leaders, editors, etc.) to each chief and to assign them the required number of Stage A and B enumerators for each section and sub-group. The teams were also supplied with questionnaires and other equipment, food, drink and vehicles: 100 tenders were used for the Census, many of which had front-wheel drive in order to reach areas to which the approach was difficult), and about 80 buses. Communication equipment and guards were supplied where necessary. The teams went out to their Enumerations Districts (some

---

(a) These enumerators included some 600 Druzes, Moslems and Christians in addition to Jews.

of which were one and a half hour's distance from the despatching station). Temporary offices were also set up in each region for the organizers, supervisors, etc., on the day of the enumeration. On completion of the enumeration the staff were returned to the despatching station and then transported home(a). The completed questionnaires were sent the same night to the C.B.S. in Jerusalem for processing.

## 7. Co-operation of the Population

The population co-operated fully; and were eager to be included in the census and to receive the slip certifying their having been enumerated. There were no refusals to answer the questions.

## 8. Supplementary Registration

In the planning of this census, attention was paid to the possibility that some of the families would not be enumerated on the appointed day, especially those living in places to which the approach is difficult (e.g., isolated houses in the mountains and nomads in tents). To ensure full coverage and in order to make it possible for all the inhabitants to receive the identity slip, a special procedure was adopted according to which the heads of family, who had not been enumerated, were asked to come on the day following the enumeration to the Military Governor's Office in the main towns. Here an enumerator filled in an "Application to be included in the Census", which was identical with the Stage A questionnaire, after the inhabitant had declared (in writing) that he had not been enumerated. Checks were made on some of the applicants by visiting his house with him, checking whether the neighbours had been enumerated, etc., in order to verify the declarations. In the Gaza Strip and Northern Sinai about 23,000 people were added in this supplementary registration, i.e. 5.8 per cent of the population, and in the Western Bank about 28,000 people (again, partly nomads), i.e. 4.8 per cent of the population; in the Golan Heights there were only very few cases. The results of the Census presented here include the supplementary registration.

## 9. Processing of the Stage A Questionnaires

On the day after the census a team of coders separated the copies intended for the Population Register and coded the locality of birth of

- 
- (a) Some of the enumerators left home at 4 or 5 a.m. and returned home at 10 or 11 p.m. (they were paid for each day of enumeration as if they had worked two days).

the heads of family (if the locality of birth was the present locality the enumerator had circled the necessary code).

The questionnaires (which were bound in books of 50 for Stage A enumerators or 25 for Stage B enumerators) were then punched. All the data of one registration unit were punched on one card in accordance with the columns printed on the questionnaire. The cards which refer to different registration units in the same household are designated by the same household number which was filled in by the enumerator in columns 9-10. In addition to these cards, a card was punched with the data on the cover of each enumerator's book, the code of the Enumeration District (6 digits - code of the region, type of settlement, the quarter in the town and a number for the specific district), a code of the enumerator's book in the Enumeration District (2 digits - as mentioned, several enumerators worked in the same Enumeration District, enumerating the households and institutions), in addition to the serial number printed in advance on the book. For checking purposes all the numbers of the books recorded on their "Distribution Form" were punched together with the Enumeration District and enumerator's number to which each was assigned. The punching was completed within two days.

The data from the cards of each region were edited on an IBM 360/30 computer (of the Office Mechanization Centre) and transferred to magnetic tapes; preliminary results were tabulated for checking purposes within five days of the enumeration. After corrections the data from the field enumeration were tabulated. The questionnaires of the supplementary registration were sorted according to the location of residence of the inhabitants (distinguishing refugee camps), coded and punched: these data were automatically edited and added to the magnetic tapes of the field enumeration. The computed tabulations of Stage A were completed by mid-October. Most of the tables in this publication were prepared by photographing the computer tabulations, after adding the names of the localities and the headings.

## LIMITATIONS OF THE RESULTS AND POSSIBLE ERRORS

In every census and statistical activity various errors are liable to occur(a). Because of the speed with which the census was prepared and conducted by a large staff and the difficult conditions under which it was carried out, it is necessary to point out the types of errors which are liable to influence the quality of the results, despite all the efforts of the Central Bureau of Statistics to ensure high quality at all stages of the operations.

The possible errors are of two main types, errors of population coverage and response errors.

### a. Errors of Population Coverage

These errors are composed of:

1. Undercoverage of residents who should have been enumerated. The detailed mapping of the areas and the study of the terrain in advance by the senior census staff (crew-leaders and above), the curfew conditions during the census days and the enumeration procedures (including the marking of houses enumerated) all facilitated a thorough coverage of the buildings, households and inhabitants. There were however some cases when, despite the use of special vehicles (and even donkeys), the enumerators could not reach isolated houses or distant localities (especially nomads' tents), because of difficulties of access or danger of mines. These inhabitants who applied to the enumerators in the Governors' offices in order to receive an identity slip, were registered and included in the processings of the census according to the supplementary procedure of "applications to be included in the census". It is however possible that a small percentage of the population was not enumerated, and in particular the results as to the nomads should be treated with caution.
2. Duplicate enumeration of the inhabitants. The curfew conditions and the instructions to the enumerators were intended, inter alia, to prevent duplicate enumeration of the inhabitants. The supplementary

---

(a) See for example Chapter B of Procedures and Definitions, Publication No. 25 of the Population and Housing Census 1961, the Central Bureau of Statistics (1965).

registration was carried out with checks in order to minimize double coverage. Nevertheless there may have been some cases of double coverage of persons who moved from area to area between enumeration days (in particular from the Gaza Strip to the West Bank).

3. Population count by location of residence. The census was carried out on a "de facto" basis, i.e. those persons present in households and institutions were registered and tabulated by their address on the census day (including those who were absent because they had a permit to move freely during the curfew). There may be differences between the locality in which they were registered and the permanent places of residence of some of the inhabitants.

b. Response Errors

These errors are the difference between the replies processed for the persons enumerated and their true characteristics. These errors (which are relatively few for the characteristics included in this publication) may be due to the following causes:

1. Replies to the enumerators. Errors are caused by the respondent's not understanding the enumerator's questions (possibly because of the various dialects of spoken Arabic), or because he does not know the facts required (e.g. the age of his wife despite efforts to utilize identity documents), or from various biases (possibly in connection with the birthplace of the family head), or because of rounding off of age.
2. Completion of the questionnaire by the enumerators. On the basis of the respondent's replies, the enumerator had to code the relevant digit as to religion and sex, and he wrote in the age and the birthplace of the family head (in Hebrew). He had also to determine the structure of the household and to fill in the questionnaires for every family unit accordingly. Sometimes there occurred errors in his understanding of the replies and in the filling in the questionnaires as to those characteristics.
3. Coding.
  - (a) Birthplaces which were different from the present locality were coded in the office and it is possible that errors were made (despite the quality control), especially as to unclear names of localities. Those birthplaces which had been divided by the Armistice lines were coded together with those "unknown".

- (b) The questionnaires from the field enumeration were kept in bound books according to the enumeration districts. This was designed to prevent errors in the coding of the localities of residence. The questionnaires from the supplementary registration were coded by location code and some errors may have been made (especially as to the refugee camps in the towns).
4. Punching of the replies. The data on all members of a family unit were punched on one card. Some mistakes crept in despite the procedures, e.g. the punching of a wrong code or the shifting of some of the fields punched because of erroneous filling in of the questionnaire (this introduced errors into other fields).
  5. Imputation. The cards were edited by the computer for completeness and consistency and imputations were made if the sex was unknown (as a result of errors in recording or punching), but some cases were left with religion or age "unknown".
  6. The processing of the cards. The use of an electronic computer and magnetic tapes prevented most of the possible processing errors. It is however possible that the data for some persons enumerated were not properly punched and were therefore not included in the tabulations: the checks ensured that non-coverage due to these errors should be very small.
  7. Preparations for publication. Most of the tables in this publication were photographed from the computer point only; thus, avoiding errors in the copying of the results. There were however some hand corrections in the lists of localities included in Tables 2 and 3, resulting in slight differences from Table 5.

The study of the results which has been carried out to date, indicates the reliability of the results. Care should be taken when making comparisons with previous data referring to these areas, because of possible differences in the definitions - especially as to definitions of the boundaries of the districts, towns and other localities.

## DEFINITIONS AND EXPLANATIONS OF CLASSIFICATIONS

### a. DEMOGRAPHIC CHARACTERISTICS

The Census Population: all persons actually present during the enumerators' visits (which were made under curfew conditions); not including persons who were absent from their homes except those who received a special permit. Also included were persons who were enumerated in the "supplementary registration" (see page XXVI).

The total population is divided, as to residence at the time of the census, into two groups: persons in households and persons in institutions.

Household: persons present during census who live together in the same dwelling and take their meals together.

Institution: hospitals, boarding schools, monasteries, hotels, etc.

Religion: in the census questionnaire the religions were divided into main groups according to their frequency in the population enumerated (see translation of questionnaire, page XXXVII). For tabulation purposes all members of the household were considered to belong to the same religion as the household-head.

Originating from Israel Territory: in the complete enumeration a question was asked concerning the locality of birth of the household head. By processing of these data a division of the household heads into four groups was obtained (listed here according to their order in Tables 5 and 9):

"Originating from locality of enumeration" - household head was born in the same locality where he/she was enumerated in the census.

"Originating from Israel territory" - household head born in the territory of the State of Israel, as it extended prior to the Six Days War.

"Originating from other locality, outside Israel territory" - household head born outside the above-mentioned territory of the State of Israel, whether in the administered territories or in other countries.

"Not known" - in addition to those from whom no reply was received or whose reply was unclear, included here are also persons born in a locality which was divided by the Armistice Line (in particular persons born in Jerusalem).

In the tabulations presented in this publication the origin of all the household members was determined according to the locality of birth of the household head (from the sample data, which will be published separately, data were also obtained on the individual origin of all the adults).

If a household head was born in a rural locality (different from the one in which he was enumerated), the instruction was given to write in the questionnaire not only the locality of birth but also the large locality near to it. This information aided in determining the geographical location of the birth place; especially where localities of identical or similar names were involved.

In the Golan Heights the question as to the locality of birth of the household head was not asked.

Age: instructions were given to the enumerators that the age should be determined according to the last birthday of the enumerated and that particular care should be taken in distinguishing those less than one year old (age 0). But it is known that among the Arab population the information on age is not always accurate, especially among elder people.

## b. GEOGRAPHICAL CHARACTERISTICS

Military Administration Areas: the tables are presented separately for the West Bank, the Gaza Strip and North Sinai, and the Golan Heights. Table 6, which furnishes a geographical breakdown, distinguishes between the Gaza Strip and North Sinai. In the Gaza Strip figures were included about 2,500 inhabitants of Rafiah who dwell south of the former international frontier in North Sinai territory.

In North Sinai only the localities in the coastal strip, from the frontier near Rafiah to El Arish inclusive, were enumerated.

In the Golan Heights the now inhabited localities, which are concentrated in the northern part, were enumerated.

Districts: the division of the West Bank into districts is in accordance with the administrative division used by the Kingdom of Jordan.

Locality: permanently inhabited place, which is situated outside the boundaries of another locality and in which at least 50 persons were enumerated. (Nockia): these are indicated in the map as Sub-districts.

Places inhabited by less than 50 persons at the time of the census were included in an adjacent locality or were grouped in the category of "living outside settlements".

Types of Settlements: in the census tabulations the classification set out below was used as to types of settlement. For technical purposes it was necessary to classify the localities before the census and the type of the settlement was therefore determined according to data of the Jordanian census of 1961 and the population estimates of the Egyptian administration in the Gaza Strip for 1966. These data will henceforth be called "previous data".

Urban Settlements - localities which according to previous data numbered at least 10,000 persons, as well as Beth Djalla (near Bethelhem). At the time of the census the population of Beth Djalla, Kalkilia and Jericho was less than 10,000.

As to urban settlements, in the area of which a refugee camp is located, a distinction was made between their population without the camp and that of the camp.

Large Villages - localities which according to previous data numbered 5,000-10,000 inhabitants, as well as 'Araqa, Yabed and Abu Dis. Also in this census the number of inhabitants in those three localities was less than 5,000.

Small Villages - permanent localities with 50-500 inhabitants.

Refugee Camps Outside Urban Settlements - in this group were included the camps run by UNRWA as well as the camps situated in Wadi Farah and the Jordan Valley.

Nomads - includes tent dwellers outside the boundaries of any locality. Nomads dwelling in the outskirts of localities were

included in the population of that locality. Former nomads who had settled in houses were enumerated as part of the rural population.

Living Outside Settlements - population in places inhabited by less than 50 persons, excluding nomads.

(a) Including the southern part of Rafah (about 2,500 inhabitants).

(b) The excess over the Egyptian estimate is probably due to differences in the area attributed to the locality.

*Error*

This table follows the Hebrew rather than English language version; in the latter the order of the row titles is incorrect.

| Persons<br>originating<br>from Israel<br>territory per<br>100 in the<br>population | Average<br>number of<br>persons per<br>household | Males per 1,000 females |          | Age -percentage (a) |       |       |          |          |            |         | Religion (percentage) |  | Total<br>Population |

NOTES

a. The percentage calculations were made for known cases.

b. Excluding refugee camps.

c. Including refugee camps inside urban settlement.

d. Beit Sahur was included among the urban settlements, while regularly it was classified among the large villages.

e. The greater part of the persons who were enumerated in the Golan Heights were Druze.

Errors

x1. From Hebrew language version in original; English mistakenly labels the row "Living outside refugee camps - total."

x2. Note d omitted in the relevant English language rows.

Census of Population 1967

HOUSING CONDITIONS, HOUSEHOLD EQUIPMENT  
WELFARE ASSISTANCE AND FARMING  
IN THE ADMINISTERED AREAS

Jerusalem, 1967

## P R E F A C E

This is the second in the series of publications of the Population and Housing Census conducted in September, 1967, in the areas administered by the Israel Defence Forces. It contains preliminary data on housing conditions and household equipment, farm cultivation and receipt of assistance. The data collected on a sample of households simultaneously with the full census give some indication of the living conditions of the various strata of the population in these areas.

The principal findings are reviewed in the Introduction which also presents comparisons between the population surveyed and the Non-Jewish sector in Israel, a description of the methods used for data collection and their limitations, and definitions of the data and their various classifications. Detailed breakdowns are given in separate tables for Judea and Samaria, the Gaza Strip, North Sinai and the Golan Heights.

A further publication on the data collected in the sample census is now in preparation, dealing with such socio-demographic aspects as fertility, infant mortality, emigration, and educational standards.

I wish to thank all those who have been instrumental in planning and carrying out this census and in publishing its results. The officials in charge of the various operations have been mentioned in the first census publication and I can but repeat my deep appreciation to Mr. Z. Eisenbach (Director of the Labour Section), Mrs. J. Zemel from this section and Mr. M. Noam (Chief Assistant Agriculture) who designed and prepared this publication.

Prof. R. Bachi  
The Government Statistician

Jerusalem, 1968.

INTRODUCTION

CHAPTER I. MAIN FINDINGS

We shall first review separately the principal findings on housing conditions and household equipment, on the receipt of assistance and on farm cultivation, and only then compare the different areas investigated with each other and with the situation in Israel. The data collected relate to different population groups. The households were grouped by type of settlement or geographic distribution (see Definitions) and by four type of population categories(a): households inside or outside refugee camps, the latter being divided into refugees and non-refugees. In addition there were households where the population group of the head of the household could not be ascertained (5.5 per cent in Judaea and Samaria, and 4.2 per cent in the Gaza Strip and North Sinai).

Since the data are based on a sample and not on a full census, sampling errors are inevitable. The sampling error is smaller in estimates relating to larger groups and bigger in estimates relating to smaller groups. Small groups where a big sampling error must be reckoned with, will appear in double parantheses(b).

1. JUDAEA AND SAMARIA

a. Households

The number of households in Judaea and Samaria - (the West Bank of Jordan) - was about 119,200 by the middle of September, 1967, with an average of 5.0 members each.

(a) For the purpose of this publication, refugees were defined as persons who reported that they lived within the territory of the State of Israel before 1948.

(b) See Chapter II.

## b. Housing Conditions

The average number of rooms per average household of 5 members was 1.9, so that the housing density was 2.6 persons per room. It was found that 45 per cent of households lived in one-room dwellings, about 31 per cent in two-room dwellings, about 14 per cent in 3-room dwellings and about 10 per cent in 4 rooms and more. This applied to all households regardless of population group category (see Table A).

Some 46 per cent of the dwellings had a kitchen but in only 43 per cent of these the kitchen was for the sole use of one household. In 41 per cent of dwellings there was an inside toilet, 23 per cent had electricity, 18 per cent had running water and 17 per cent had a bath. There were considerable differences between the urban and rural population. For instance, 75 per cent of the urban households had a special room for the kitchen as against only 33 per cent of the rural households; 77 per cent of urban households had inside toilets as against 27 per cent of rural households.

TABLE A.- HOUSEHOLDS WITH FACILITIES, BY TYPE OF SETTLEMENT

| F a c i l i t i e s        | Total   | Urban<br>Settlements | Rural<br>Settlements | Refugee<br>Camps |
|----------------------------|---------|----------------------|----------------------|------------------|
| Absolute Numbers           |         |                      |                      |                  |
| HOUSEHOLDS                 | 119,165 | 30,340               | 77,707               | 11,118           |
| Percentages                |         |                      |                      |                  |
| Kitchen                    | 45.5    | 74.7                 | 33.4                 | 50.2             |
| Toilet inside the building | 40.5    | 76.5                 | 26.9                 | 37.1             |
| Running water              | 17.8    | 56.9                 | 4.1                  | 6.9              |
| Bath                       | 17.3    | 41.7                 | 9.3                  | 6.6              |
| Electricity                | 23.1    | 71.0                 | 6.7                  | 7.1              |

Accordingly the standard of facilities in refugee households was not much lower than in non-refugee households, for although the standard of facilities in refugee camps was lower than among the urban population it was considerably higher than among the rural population, so that refugee camp residents were not far behind the general average for the total population of Judaea and Samaria.

Table B shows that the standard of facilities of refugee households living outside refugee camps (constituting over half the refugees in Judaea and Samaria) was practically the same as of the surrounding population. About 6,000 refugee households in urban settlements were slightly behind their non-refugee neighbours, but the other 6,000 refugee households in rural settlements had better housing facilities than the rest of the village population.

TABLE B.- HOUSEHOLDS WITH FACILITIES, BY TYPE OF POPULATION AND TYPE OF SETTLEMENT

| F a c i l i t i e s | Total<br>(a) | Refugee<br>Camps | Outside Refugee Camps |              |                      |              |
|---------------------|--------------|------------------|-----------------------|--------------|----------------------|--------------|
|                     |              |                  | Urban<br>Settlements  |              | Rural<br>Settlements |              |
|                     |              |                  | Refugees              | Non-refugees | Refugees             | Non-refugees |

| Absolute Numbers |         |        |       |        |       |        |
|------------------|---------|--------|-------|--------|-------|--------|
| HOUSEHOLDS       | 119,165 | 11,118 | 5,969 | 22,202 | 5,945 | 67,415 |

| Percentages                |      |      |      |      |       |      |
|----------------------------|------|------|------|------|-------|------|
| Kitchen                    | 45.5 | 50.2 | 73.5 | 75.1 | 39.3  | 33.1 |
| Toilet inside the building | 40.5 | 37.1 | 73.2 | 77.3 | 33.2  | 26.5 |
| Tap inside the dwelling    | 17.8 | 6.9  | 55.8 | 57.1 | (5.5) | 4.0  |
| Bath                       | 17.3 | 6.6  | 39.2 | 42.0 | 11.0  | 9.1  |
| Electricity                | 23.1 | 7.1  | 64.3 | 72.6 | (7.6) | 6.4  |

(a) Including households whose type of population is not known.

The data show that the households having the facilities enumerated are on the average bigger than the rest. For instance, households which have the sole use of a kitchen had an average of 5.5 members as against 4.6 members in households which share the use of a kitchen.

c. Household Equipment

The investigation included radio sets, television and refrigerators. There were some 68,600 households in Judaea and Samaria who had a radio set in their possession, or about 58 per cent of the total. Some 2,100 households or about 1.8 per cent had television sets and about 570 households or about 5 per cent had refrigerators.

TABLE C.- HOUSEHOLDS WITH SELECTED ITEMS OF HOUSEHOLD EQUIPMENT, BY TYPE OF SETTLEMENT (Percentages)

| Household Equipment   | Refugee Camps | Outside Camps     |                   |
|-----------------------|---------------|-------------------|-------------------|
|                       |               | Urban Settlements | Rural Settlements |
| Radio                 | 59.9          | 72.5              | 51.9              |
| Television            | ((0.7))       | 6.2               | ((0.2))           |
| Electric refrigerator | ((0.9))       | 17.7              | ((0.3))           |

As in the case of facilities it was again found that the standard of households in refugee camps was higher than that of households in rural settlements but lower than that in urban settlements. Thus, about 60 per cent of households in refugee camps had a radio as against 52 per cent of rural households and 73 per cent of urban households.

The differences between refugee and non-refugee households living outside the camps were found to be very small both in the town and in the country. In urban settlements, for instance, some 73 per cent of both refugee and non-refugee households had radios as against about 58 per cent of refugee and 52 per cent of non-refugee households in the villages (see Table D).

TABLE D.- HOUSEHOLDS WITH HOUSEHOLD EQUIPMENT, BY TYPE OF POPULATION AND TYPE OF SETTLEMENT (Percentages)

| Household Equipment   | Total (a) | Refugee Camps | Outside Refugee Camps |              |                   |              |
|-----------------------|-----------|---------------|-----------------------|--------------|-------------------|--------------|
|                       |           |               | Urban Settlements     |              | Rural Settlements |              |
|                       |           |               | Refugees              | Non-refugees | Refugees          | Non-refugees |
| Radio                 | 57.9      | 59.9          | 73.3                  | 72.6         | 57.8              | 51.8         |
| Television            | 1.8       | ((0.7))       | (7.0)                 | 5.8          | ((0.9))           | ((0.2))      |
| Electric refrigerator | 4.8       | ((0.9))       | 19.3                  | 16.8         | (1.0)             | ((0.3))      |

(a) Including households where it is not known whether their head is a refugee.

d. Assistance

About 30 per cent of all households in Judaea and Samaria were registered with UNRWA or received assistance from this agency. Some 80 per cent of households living in refugee camps were registered or received UNRWA assistance as against 72 per cent of refugee households living outside the camps. It is interesting to note that also some 18 per cent of households living outside the camps and not enjoying refugee status according to the answers they gave, received UNRWA assistance or were registered on its lists.

About 14 per cent of all households reported that they received assistance from relatives abroad while another 5.2 per cent received other forms of assistance (from UNICEF, Care or other sources).

TABLE E.- HOUSEHOLDS RECEIVING ASSISTANCE, BY TYPE OF ASSISTANCE  
AND TYPE OF POPULATION (Percentages)

| Type of Assistance                           | Total<br>(a) | In<br>Refugee<br>Camps | Outside Camps |                  |
|----------------------------------------------|--------------|------------------------|---------------|------------------|
|                                              |              |                        | Refugees      | Non-<br>refugees |
| Receiving assistance or listed<br>with UNRWA | 30.2         | 85.6                   | 72.0          | 17.9             |
| Assistance from relatives abroad             | 14.1         | 6.9                    | 14.2          | 15.1             |
| Other assistance                             | 5.2          | (2.3)                  | (3.7)         | 5.7              |

(a) Including households where it is not known whether their head is a refugee or not.

The average household receiving assistance from UNRWA or registered on its lists and living in refugee camps had 5.2 members, while the household size of refugees living outside camps averaged 5.5. The average size of non-refugee households was 5.2.

e. Farm Cultivation - Number of Households and Their Population

In the 1967 Population Census, 51,000 or 42 per cent(a) of the 119,200 households in Judaea and Samaria were found to have farms and their population amounted to 283,700 persons or 47 per cent of the total population. To compare these data with the findings of the Jordanian Farm Census of 1953 another 1,000 farms in East Jerusalem must be added. A total of 52,100 farms is thus obtained compared with 60,750 according to the Jordanian Census. The reduction in the number of farms was particularly striking in the central regions of Judaea and Samaria - the Ramallah, Jerusalem, Jericho and Bethlehem sub-districts. Emigration before June, 1967, and during the war is the main reason why the number of farms shrank by about 9,000 from 1953 until 1967.

Farm Structure

Fruit plantations were found in 68 per cent of all farms and in 26 per cent they were the sole branch of agriculture.

(a) Another 879 households failed to report whether they had a farm or not while presumably some farms were maintained jointly by several households.

Field crops were grown by about 58 per cent of the farms, and exclusively so by about 13 per cent. Vegetables were grown by 29 per cent of the farms with 3 per cent specializing exclusively in truck farming while livestock - cattle or sheep - were maintained by 23 per cent of the farms of which about 4 per cent specialized exclusively in animal husbandry.

A similar ranking of these 4 branches of agriculture was obtained from the output and cultivated area estimates for 1965/66 of the Ministry of Agriculture which are presented for comparison in Table F.

TABLE F.- FARMS IN ACCORDING TO THE 1967 POPULATION CENSUS AND ESTIMATES  
OF OUTPUT AND CULTIVATED AREA,  
BY THE ISRAELI MINISTRY OF AGRICULTURE FOR 1966

| Branch of Agriculture | Reporting Farms<br>1967 Census |             | Estimated<br>1965/66 Output<br>at<br>1962/63 Prices |             | Estimated<br>Cultivated Area,<br>1965/66 |             |
|-----------------------|--------------------------------|-------------|-----------------------------------------------------|-------------|------------------------------------------|-------------|
|                       | 1,000 Farms                    | Percentages | Million Dinars                                      | Percentages | Million Dunams                           | Percentages |
| ALL FARMS             | 51.1(a)                        | 100(a)      | 13.7                                                | 100         |                                          |             |
| Crops                 | 50.2                           | 96          | 11.3                                                | 82          | 1,919(b)                                 | 100         |
| Field crops           | 29.8                           | 58          | 2.9                                                 | 21          | 849                                      | 44          |
| Vegetables            | 15.0                           | 29          | 3.7                                                 | 27          | 255                                      | 13          |
| Fruit plantations     | 34.7                           | 68          | 4.7                                                 | 34          | 815(b)                                   | 43          |
| Livestock             | 11.8                           | 23          | 2.4                                                 | 18          |                                          |             |

(a) The data cannot be summed up because most of the farms engage in more than one branch.

(b) Fruit-bearing only; there were another 162,000 dunams of young plantations.

Sources: Number of farms - Population Census, 1967.

Output and cultivated area - estimates of the Ministry of Agriculture, based on current Jordanian statistics.

TABLE G.- HOUSEHOLDS WITH FACILITIES, BY TYPE OF SETTLEMENT

| Kitchen                    |                  | 63.2              | 24.7              | 53.8          |
| Toilet inside the building | 55.7             | 58.8              | 9.3               | 35.3          |
| Tap inside the dwelling    | 44.0             | 46.9              | (2.8)             | 16.2          |
| Bath                       | 29.3             | 32.5              | (4.7)             | 8.9           |
| Electricity                | 19.5             | 34.0              | (3.1)             | 4.2           |
|                            | 17.9             |                   |                   |               |

TABLE H.- HOUSEHOLDS WITH FACILITIES, BY TYPE OF POPULATION AND TYPE OF SETTLEMENT

| Facilities                 | Total (a)   | Urban Settlements |              | Rural Settlements |              |
|----------------------------|-------------|-------------------|--------------|-------------------|--------------|
|                            |             | Refugees          | Non-refugees | Refugees          | Non-refugees |
| HOUSEHOLDS                 | 66,819      | 8,126             | 20,417       | 1,600             | 3,741        |
|                            | Percentages |                   |              |                   |              |
| Kitchen                    |             | 59.8              | 65.6         | 19.2              | 28.3         |
| Toilet inside the building | 55.7        | 56.3              | 60.7         | (5.3)             | (11.3)       |
| Tap inside the dwelling    | 44.0        | 43.4              | 49.1         | (1.8)             | 3.5          |
| Bath                       | 29.3        | 25.9              | 35.1         | (1.4)             | (6.0)        |
| Electricity                | 19.5        | 30.8              | 36.0         | 0.7               | (3.9)        |
|                            | 17.9        |                   |              |                   |              |

(a) Including households where it is not known whether their head is a refugee.

## Average Farm Size

From Table F it might appear that the average farm had about 38 dunams but in fact the average farm size was less because the data relate to the area before the Six Day War whereas in 1967 there were fewer farmers, many having emigrated.

## f. Type of Population (see Table L)

Some 10 per cent of all households in the refugee camps had farms and if the households of unknown status are left out of account, about 22 per cent of refugees living outside the camps had farms. Of the non-refugee population outside the camps, some 50 per cent were farmers.

## 2. THE GAZA STRIP AND NORTH SINAI

## a. Households

There were 66,800 households in the Gaza Strip and North Sinai with an average of 5.9 members each. Of these about 31,000 lived in urban settlements, about 6,000 in rural settlements and about 30,000 in refugee camps.

## b. Housing Conditions

The average household of 5.9 members had 2.3 rooms so that the average housing density was 2.6 persons per room. 28 per cent of households lived in one-room dwellings, about 38 per cent in two rooms, about 20 per cent in three rooms and about 15 per cent in four rooms or more. Some 11 per cent of refugee households living outside camps had four rooms or more as against 19 per cent of non-refugees. About 44 per cent of the dwellings had a toilet inside the building, 56 per cent had a kitchen and 29 per cent - tap inside the building. As in Judaea and Samaria, there were considerable differences in the standard of facilities between urban and rural households (see Table G).

Thus, as in Judaea and Samaria, the standard of facilities was lower in the refugee camps than in the urban settlements, but higher than in the rural settlements. About 63 per cent of households in the urban settlements had a kitchen as against 54 per cent in refugee camps and only 25 per cent in rural settlements. The standard of facilities in households of refugees living outside the camps - some 10,000 in number - was somewhat lower than of the non-refugees among whom they were living, both in urban and in rural areas, as may be seen from Table H.

The data show that the average household having facilities investigated, was somewhat bigger than the average household lacking these facilities. For example, households with a kitchen for their own use had 6.5 members on the average as against households which shared the use of a kitchen whose average size was 5.0

#### c. Household Equipment

It was found that about 48 per cent of households had a radio or transistor radio set, about 3.3 per cent a television set, and about 2.5 per cent an electric refrigerator. From the distribution by type of settlement and type of population, the same picture emerges as found with respect to facilities (Table I).

TABLE I.- HOUSEHOLDS WITH SELECTED ITEMS OF HOUSEHOLD EQUIPMENT, BY TYPE OF SETTLEMENT AND TYPE OF POPULATION

| Household Equipment   | In Refugee Camps | Outside Refugee Camps |          |              |         |          |              |
|-----------------------|------------------|-----------------------|----------|--------------|---------|----------|--------------|
|                       |                  | Urban                 |          |              | Rural   |          |              |
|                       |                  | Total (a)             | Refugees | Non-refugees | Total   | Refugees | Non-refugees |
| Radio                 | 44.3             | 54.3                  | 53.2     | 55.9         | 30.3    | 22.2     | 35.4         |
| Television            | ((0.4))          | 6.7                   | 6.8      | 7.0          | ((0.2)) | ((0.0))  | 0.3          |
| Electric refrigerator | ((0.1))          | 5.2                   | (5.2)    | 5.5          | ((0.1)) | ((0.4))  | 0.0          |

#### d. Assistance

About 67 per cent of all households in the Gaza Strip and in North Sinai received assistance from or were registered with UNRWA. In the refugee camps 91 per cent of households were so supported and outside the camps 84 per cent of refugee households and 31 per cent of non-refugee households - were either supported or registered. Assistance from relatives

TABLE J.- FARM DATA IN THE GAZA STRIP (a) ACCORDING TO THE POPULATION CENSUS-1967 AND THE WATER COMMISSIONER'S AERIAL PHOTOGRAPHY SURVEY OF JULY 1967

| Branch of Agriculture            | Reporting Farms - 1967 Census |             | Area in Dunams |                  |
|----------------------------------|-------------------------------|-------------|----------------|------------------|
|                                  | Number of Farms               | Percentages | Total          | Average per Farm |
| TOTAL FARMS IN GAZA STRIP        | 8,577(b)                      | 100         |                |                  |
| Farms with farmlands             | 7,650                         | 89          | 261,300(c)     | 34               |
| Fruit plantations (incl. citrus) | 5,617                         | 65          | 157,800        | 28               |
| Field crops and/or vegetables    | 4,343                         | 51          | 103,500        | 24               |

(a) Another 782 farm households were enumerated in North Sinai.  
(b) The data cannot be summed up because most of the farms engage in more than one branch of agriculture.

(c) Not including 1,342 dunams of uncultivated land.

Sources: Number of farms - Population Census, 1967.  
Area "The Gaza Strip", the Consumption Survey Unit, The Water Commissioner, Tel Aviv, November, 1967.

abroad were received by about 7 per cent of all households - about 8 per cent of households in refugee camps, 8 per cent of refugee households outside the camps and about 6 per cent of non-refugee households. Households receiving assistance or registered with UNRWA - whether inside the camps or outside the camps, refugee or non-refugee families, had an average 6.0 (6.1 outside camps) members.

e. Farm Cultivation

In the Gaza Strip and in North Sinai there are fewer households with farms than in Judaea and Samaria. Out of a total of 66,800 households only about 9,400 or 14 per cent - numbering 63,000 persons or 16 per cent of the total population - were farmers.

Farm Structure

As in Judaea and Samaria fruit plantations were the principal branch of agriculture, engaged in by 6,000 or 64 per cent of all farms and exclusively so by 36 per cent. Field crops were found in 36 per cent of the farms with 9 per cent specialising exclusively in this branch. Vegetables were grown by 25 per cent of the farmers of whom 5 per cent specialised exclusively in this branch. Livestock was kept by 27 per cent of the farms, including 12 per cent where it was the sole farming activity.

Average Farm Size in Gaza Strip

By comparing the census results with data obtained by the Israel Water Commissioner from an aerial survey of the Gaza Strip conducted in July, 1967, it is seen that the average size of crop-growing farms was 30 dunams, the average plantation area was 28 dunams and the average field crop or vegetable area - 24 dunams(a).

f. Type of Population

Some 900 households inside the refugee camps operated a farm, as well as some 1,200 refugee households outside the camps. In addition, there were some 600 households of unknown status engaged in farming.

- (a) The figures published by the Egyptian Military Government on the cultivated area in the Gaza Strip are at variance with the aerial survey findings so that the provisional means computed accordingly are incorrect.

Accordingly, some 3 per cent of refugee households inside the camps and about 12 per cent of refugee households outside the camps were farmers as against 28 per cent of non-refugees outside the camps - not counting households of unknown status.

3. THE GOLAN HEIGHTS

The 1,331 households enumerated in the Golan Heights comprised a population of 6,300. For particulars on their housing conditions, facilities and household equipment, see Table 16. The average housing density was 2.0 persons per room - lower than in any of the other areas. On the other hand the standard of facilities and household equipment was found to be generally lower except as regards the water and electricity supply - about 50 per cent of the households were connected to the electricity grid and about 29 per cent had running water.

a. Number of Farms and Population

As many as 1,040 households - 78 per cent of all households comprising 5,391 persons or 85 per cent of the total population - reported that they operated a farm. Since in the Golan Heights the entire population was covered by the survey forming Stage B of the Census, absolute figures on the farm structure can be given as there are no sampling errors. It was found that 876 of the 1,040 farms or 84 per cent had plantations, and for 496 this was the sole crop, while 303 farms (29 per cent) cultivated field crops, 40 of them exclusively so. Vegetables were grown by 109 or 5 per cent of the farms but only 6 farms made this their exclusive speciality. As many as 407 farms or 39 per cent kept livestock - cattle, sheep and goats - by only 39 specialised therein.

4. COMPARISON BETWEEN AREAS INVESTIGATED AND THE NON-JEWISH SECTOR IN ISRAEL

A major difference in household characteristics between Judaea and Samaria on the one hand and the Gaza Strip and North Sinai on the other, is the differential distribution by type of settlement:

In Judaea and Samaria 30,000 households or 26 per cent of the total lived in urban settlements and 77,700 or 65 per cent in rural settlements as against 31,000 or 46 per cent of households in the Gaza Strip and North Sinai living in urban settlements and only 5,700 or 7 per cent in rural settlements. In Judaea and Samaria, moreover, only 11,100 or 9 per cent of households lived in refugee camps as against 30,200 or 45 per cent in the Gaza Strip and North Sinai.

b. Facilities

The average housing density both in the Gaza Strip and in Judaea and Samaria was 2.6 per cent per room, but only 2.0 persons in the Golan Heights. Among Non-Jewish households in Israel the average housing density in 1966 was 2.9 persons per room.

The standard of facilities differed considerably between the Gaza Strip and North Sinai and Judaea and Samaria. In the refugee camps in the Gaza Strip and North Sinai the standard - except for electricity - was higher than elsewhere in the camps.

TABLE K.- HOUSEHOLDS IN REFUGEE CAMPS HAVING FACILITIES, BY AREA (Percentages)

| Facilities                 | Judaea and Samaria | Gaza Strip and North Sinai |
|----------------------------|--------------------|----------------------------|
| Kitchen                    | 50.2               | 53.8                       |
| Toilet inside the building | 26.9               | 35.3                       |
| Tap inside the dwelling    | 6.9                | 16.2                       |
| Bath                       | 6.6                | 8.9                        |
| Electricity                | 7.1                | 4.2                        |

In the urban and rural settlements of Judaea and Samaria the standard of facilities was higher than in the Gaza Strip and North Sinai but since the standard of facilities in urban settlements was higher than in rural settlements and most of the Gaza Strip is urban, the standard of facilities of households in the Gaza Strip and North Sinai generally was higher than of households in Judaea and Samaria. Thus 75 per cent of urban households in Judaea and Samaria and 63 per cent in the Gaza Strip and North Sinai had a kitchen against 33 per cent and 25 per cent, respectively, in rural households, but taking the aggregates for both areas it is seen that 46 per cent of households in Judaea and Samaria and 50 per cent of households in the Gaza Strip and North Sinai were so equipped.

The standard of facilities of Non-Jewish households in Israel was higher than either in Judaea and Samaria or in Gaza and North Sinai. The same applies to rural and urban settlements, taken separately. In Israel, for instance, 39 per cent of Non-Jewish households have electricity as compared with 28 per cent in Judaea and Samaria and 18 per cent in the Gaza Strip and North Sinai. Eighty per cent of urban Non-Jewish Israeli households have electricity as against 34 per cent of urban households in the Gaza Strip and North Sinai and 71 per cent in Judaea and Samaria, see Table L.

TABLE L.- HOUSEHOLDS WITH FACILITIES, BY TYPE OF SETTLEMENT IN JUDAEA AND SAMARIA, THE GAZA STRIP AND NORTH SINAI AND IN THE NON-JEWISH SECTOR OF ISRAEL (Percentages)

| Facilities    | Total                  |            |                    | Urban              |            |                    | Rural              |                            |                        |
|---------------|------------------------|------------|--------------------|--------------------|------------|--------------------|--------------------|----------------------------|------------------------|
|               | Judaea and Samaria (a) | Gaza Strip | Non-Jews in Israel | Judaea and Samaria | Gaza Strip | Non-Jews in Israel | Judaea and Samaria | Gaza Strip and North Sinai | Non-Jews in Israel (b) |
| Kitchen       | 45.5                   | 55.6       | 63.6               | 74.7               | 63.2       | 83.0               | 33.4               | 24.7                       | 56.8                   |
| Inside toilet | 40.5                   | 44.0       | 34.1               | 76.5               | 58.8       | 64.2               | 26.9               | 9.3                        | 23.5                   |
| Running water | 17.7                   | 29.3       | 51.6               | 56.9               | 46.9       | 80.3               | 4.1                | (2.8)                      | 41.5                   |
| Bathroom      | 17.3                   | 19.5       | 24.6               | 41.7               | 32.5       | 43.2               | 9.3                | (4.7)                      | 18.2                   |
| Electricity   | 23.1                   | 17.9       | 39.1               | 71.0               | 34.0       | 79.5               | 6.7                | (3.1)                      | 25.4                   |

(a) Including refugee camps. (b) Data of Household Equipment Survey, 1966

c. Household Equipment

As in the case of facilities the percentage of households having various items of household equipment (except television sets) is higher in Judaea and Samaria than in the Gaza Strip and North Sinai, both in urban and in rural settlements.

TABLE M.- HOUSEHOLDS HAVING SELECTED ITEMS OF HOUSEHOLD EQUIPMENT,  
BY TYPE OF SETTLEMENT IN JUDAEA AND SAMARIA, THE GAZA STRIP  
AND NORTH SINAI AND IN THE NON-JEWISH SECTOR OF ISRAEL  
(Percentages)

| Household Equipment   | Total                  |                |                    | Urban              |            |                    | Rural              |            |                    |
|-----------------------|------------------------|----------------|--------------------|--------------------|------------|--------------------|--------------------|------------|--------------------|
|                       | Judaea and Samaria (a) | Gaza Strip (a) | Non-Jews in Israel | Judaea and Samaria | Gaza Strip | Non-Jews in Israel | Judaea and Samaria | Gaza Strip | Non-Jews in Israel |
| Radio                 | 57.9                   | 47.7           | 82.3               | 72.5               | 54.3       | -                  | 51.9               | 30.3       | -                  |
| Television            | 1.8                    | 3.3            | 3.5                | 6.2                | 6.7        | (11.5)             | 0.2                | 0.2        | 0.5                |
| Electric refrigerator | 4.8                    | 2.5            | 11.0               | 77.7               | 5.2        | 35.6               | 0.3                | 0.1        | 1.7                |

(a) Including refugee camps.

(b) Data of Household Equipment Survey, 1966.

Comparison between Judaea and Samaria, the Gaza Strip and North Sinai with the Non-Jewish sector of Israel shows that a higher percentage of Israeli households have various items of equipment in their homes. For instance, as many as 82 per cent of Non-Jewish households in Israel had radios and 3.5 per cent television sets, compared with much lower percentages in the areas investigated.

#### d. Assistance

More households in Judaea and Samaria - about 14 per cent - received assistance from relatives abroad than in the Gaza Strip and North Sinai (about 7 per cent). On the other hand more households in the Gaza Strip and North Sinai reported that they were receiving support from or registered with UNRWA - 67 per cent as against a mere 30 per cent in Judaea and Samaria - but it should be borne in mind that there were more refugee households in North Sinai and the Gaza Strip.

#### e. Farm Cultivation

Considerable differences were found between the proportion of farm households in the areas investigated. The Golan Heights ranked highest with 78 per cent, followed by Judaea and Samaria with 43 per cent and the Gaza Strip and North Sinai with only 14 per cent. In rural settlements (excluding refugee camps) 57 per cent of households in Judaea and Samaria and 41 per cent in Gaza Strip and North Sinai operated a farm. For further specification by type of settlement, see tables 12 and 23.

## CHAPTER II. ORGANIZATION OF THE CENSUS AND LIMITATION OF THE RESULTS

This publication (the second in the series) presents data on housing conditions, facilities, cultivation of agricultural farms and receipt of assistance. These data were collected in the course of the Census of Population 1967, conducted in the territories administered by the Israel Defence Forces. The census procedures and its organization were outlined in publication No. 1 in this series.

The questions relating to the topics dealt with in the present publication were contained in a supplementary detailed questionnaire used for a sample of 20 per cent of all households (Stage B questionnaire) in addition to the general Stage A questionnaire which was filled in for the whole population and contained only basic demographic particulars.

From the sample data estimates were drawn up for the entire population according to a method to be described below.

### 1. The Population

The data in this publication relate to all households present in the administered areas on the census data, except the population living in institutions and nomads (119,200 in Judaea and Samaria and 66,800 in the Gaza Strip and North Sinai).

### 2. The Survey Unit

For the characteristics, which are the subject of the present publication each household was considered as a survey unit, consisting of those persons present at the time of the Census, living in the same dwelling unit and having most of their meals together.

### 3. Method of Investigation

The data were obtained by interviewing the households in their homes. Enumerators called on all households included in the sample and filled in a Stage B questionnaire immediately after the completion of the Stage A questionnaire (except in the Golan Heights where the Stage B questionnaire was filled in for the entire population about two weeks after the general Stage A of the Census was taken). A copy of the Stage B questionnaire is shown in the Appendix. A curfew was imposed during the Census.

### 4. Sampling Method

As noted, the characteristics of the population presented in this publication were collected for a representative 20 per cent sample of the households in Judaea and Samaria, the Gaza Strip and North Sinai.

The buildings in which the population of the area resided were mapped before the Census and divided into "Enumeration Districts", with an average of 55 households in each(a). The sample was a sample of enumeration districts (cluster sample), drawn systematically from geographical strata. Although this method introduced a certain clustering which lessened the precision of the estimates, it was, nevertheless, simpler and more convenient from an organizational point of view. The special conditions under which the Census was conducted (in one day, under curfew conditions and with the enumerators working in teams, etc.) prevented taking an unclustered sample.

### 5. Field Work

About 750 special enumerators (Stage B enumerators) carried out the Census in the sample enumeration districts (Stage B districts). For this purpose enumerators of a higher standard and with a better knowledge of Arabic were chosen. They received 10-12 hours comprehensive instructions and training before going in the field (compared with only 4 hours for Stage A enumerators).

The field work was carried out in teams. Each team of Stage B enumerators was composed of 4-6 enumerators and was responsible for one Stage B enumeration district. A special Stage B crew-leader was in charge of one or two teams.

The filled-in questionnaires were handed in during the day to a field office in charge of 3-4 crew-leaders (of whom 1 or 2 were Stage B supervisors) where they were first edited by a special editor of each field office. Special care was taken in editing the Stage B questionnaires and as a result further enquiries were made or corrections introduced whenever required.

- (a) In the Golan Heights a detailed questionnaire was filled in for all households while in one "region" in Judaea and Samaria the Stage B questionnaire was filled in for a sample of only 15 per cent of the enumeration districts because of a shortage of personnel.

This was followed in the Jerusalem Office of the Central Bureau of Statistics by further editing during the coding. The coded questionnaires were punched on punch-cards with one for each household and one for every person aged 15 years and above. A computer edit-check was then carried out and logical inconsistencies were corrected according to predetermined instructions. The material was then processed to a set of standard tables on an IBM 360/30 computer at the Office of Mechanization Centre.

#### 6. Method of Estimation

In order to obtain estimates for the total population from the sample surveyed, the data had to be multiplied by a suitable raising factor. Although approximately one fifth of the enumeration districts were selected for Stage B enumeration, this factor was usually higher than 5 because of:

- a. variations in the size of the enumeration districts;
- b. field-work errors, Stage B questionnaires not being filled in for part or whole of an enumeration district included in the sample or being filled in for enumeration districts not so included;
- c. non-inclusion of the (Stage B) characteristics in the supplementary enumeration conducted after the full census.

For the sake of statistical accuracy a different raising factor was therefore used for different groups of enumeration districts or inflation categories, as follows:

##### a. Population outside refugee camps

- (1) Towns - each town separately
- (2) Urban settlements - by sub-districts in the "census region"
- (3) Rural settlements - by sub-districts in the "census region"

##### b. Population in refugee camps

- (1) Gaza Strip and North Sinai - in the towns, every refugee quarter was considered as a separate inflation category while the remaining refugee camps in the region constituted one inflation category.
- (2) Judaea and Samaria - all refugee camps in each "census region" constituted one inflation category.

The inflation factor F was determined as follows for each inflation category:

$$F = \frac{\text{total number of persons aged 15 years and above in Stage A}^{(a)}}{\text{total number of persons aged 15 years and above in Stage B}}$$

In this way it was intended that all estimates for adults aged 15 years and above in a tabulation for one or several inflation categories should correspond to the full census population. Nevertheless, the number of persons and households in Stage A and B does not fully coincide owing to sampling errors and differences in investigation and processing methods which led to a slight difference between Stage A and Stage B in the average number of adults per household(b).

The total number of persons in Judaea and Samaria, according to Stage A of the Census, was 594,089, in the Gaza Strip and North Sinai 377,307 and in the Golan Heights 6,396 while the respective figures obtained according to Stage B were 603,378, 394,433 and 6,312.

It should further be noted that in the Gaza Strip the classification of the urban population included in the supplementary census registration as regards residence inside or outside refugee camps, was faulty. This error was not corrected in the tabulation of the basic questions but an effort was made to correct it in the tabulation of the detailed data. Hence the total of refugee camp residents in the two tabulations is not identical (the correction was, however, made for Rafiah, Khan Yunis and Dir el Bella).

#### 7. Limitations of the Figures

Like any statistical activity, the results of this Census are also subject to a number of limitations:

- a. Response errors and errors of processing - these errors result from inaccurate replies and from errors in recording, coding, punching or processing. It should be noted, that a part of these errors tend to cancel each other in the totals.

- (a) Including those enumerated in the supplementary registration apart from residents of institutions and nomads.
- (b) See Census of Population 1967 Publication No. 1, pp. XXX-XXXII. The difference between Stage A and B in the Golan Heights is due not to sampling errors but to the time interval between the two stages.

b. Errors resulting from the sampling:

- (1) Biases due to the fact that the household sample and the the households actually investigated and processed were not fully identical because of defects in implementing the sample and because the population included in the supplementary registration was not investigated in Stage B. When the data were processed the sample characteristics for each strata were imputed also to the population not directly represented by means of a proportional estimate; this, however, led to certain minor biases, for instance, regarding estimates of households and total population.
- (2) Sampling errors: The estimates suffer also from errors that result from the fact that the survey was based on a sample and not on a complete census of all households. As the sample included some 20,000 households in Judaea and Samaria and about 11,000 in the Gaza Strip and Northern Sinai, the sampling errors are very small for estimates referring to large groups (e.g. total population) and to common occurrences. On the other hand, as the estimates refer to smaller geographical groups (e.g. individual settlements) or to rarer occurrences, the effect of the sampling errors increases.

For lack of time, exact estimates of the sampling errors have not yet been drawn up. Only very rough estimates were made in order to caution the reader in respect of estimates for which the sampling error might be considerable.

Indication of Sampling Errors in this Publication

All data are divided into three categories:

- a. Data relating to over 450 households (or the corresponding population) or percentages based on denominators of this size. Here the sampling error is estimated as less than 30 per cent and no special notation was used for these figures. (It should, however, be noted that these figures may also be affected by other errors noted above).
- b. Data relating to 250-449 households or percentages based on a denominator of this size, or data relating to over one per cent of the total (but less than 450 households). These figures were put in parenthesis to indicate that they are subject to a high sampling error.

- c. The remaining data were put in double parenthesis to indicate that they are subject to a very high sampling error.

Figures relating to persons were parenthesized or not according to the corresponding figure for households.

Confidence Intervals

Let  $P$  be the percentage of households with a given characteristic,  $\hat{P}$  the estimated percentage according to the sample, and  $\bar{N}$  the estimated total on which this percentage was calculated. The following table shows the interval within which  $P$  may be found with a probability of 95 per cent, the "95 per cent of confidence interval for  $P$ ."

The estimates of the confidence intervals were based on the following formula for sample variance:

$$\hat{\sigma}^2_{\hat{P}} = \frac{(1-f) P(1-P)}{n} \left[ 1 + f(\bar{N} - 1) \right]$$

where  $P$  is the estimated percentage having the characteristic in question in a given population, (e.g. the entire area, a sub-district, a given settlement).

- |                            |   |                                                          |
|----------------------------|---|----------------------------------------------------------|
| $f$                        | - | total sampling rate                                      |
| $n$                        | - | sample size of households in that population             |
| $\bar{N}$                  | - | average size of enumeration district, i.e. 55 households |
| $f$                        | - | arbitrary estimate of the intra-group correlation - 0.1. |
| $\hat{\sigma}^2_{\hat{P}}$ | - | estimate of sampling variance of estimate $\hat{P}$      |

See, e.g. M. Hansen, W. Hurwitz, W. Madow: Sample Survey Methods and Theory, Vol. I, Wiley, New York, 1953, p. 259

CONFIDENCE INTERVAL OF 95 PERCENT FOR VARIOUS VALUES OF  $\hat{P}$  AND  $\hat{N}$

| $\hat{N}$ Estimate of the Total Population (Households) | $\hat{P}$ - Estimates of Percentage |          |          |      |       |       |               |
|---------------------------------------------------------|-------------------------------------|----------|----------|------|-------|-------|---------------|
|                                                         | 1%                                  | 2%       | 5%       | 10%  | 20%   | 30%   | More Than 30% |
| 1,000                                                   | 0.2-15.5                            | 0.3-16.9 | 1-19.5   | 2-28 | 7-40  | 14-52 | $P \pm 19.5$  |
| 2,000                                                   | 0.2- 9.0                            | 0.3-10.8 | 1.1-15.2 | 4-22 | 10-34 | 18-44 | $P \pm 13.8$  |
| 5,000                                                   | 0.2- 4.9                            | 1.4- 6.4 | 2.1-10.6 | 6-16 | 14-28 | 22-39 | $P \pm 8.7$   |
| 10,000                                                  | 0.2- 3.3                            | 0.4- 4.7 | 2.7- 8.6 | 7-14 | 15-26 | 25-35 | $P \pm 6.2$   |
| 20,000                                                  | 0.4- 2.6                            | 1.1- 3.6 | 3.4- 7.2 | 8-13 | 17-24 | 26-34 | $P \pm 4.4$   |
| 50,000                                                  | 0.5- 2.2                            | 1.4- 2.9 | 3.8- 6.1 | 8-12 | 18-22 | 28-32 | $P \pm 2.8$   |
| 100,000                                                 | 0.6- 1.7                            | 1.6- 2.8 | 4.2- 5.9 | 9-11 | 18-22 | 28-32 | $P \pm 2$     |

Example for the use of a table of confidence interval

- If  $\hat{N} = 5,000$   $P = 5\%$  we obtain that the census proportion is within the confidence limits of 95% between 2.1% and 10.6%.
- For a  $\hat{P}$  larger than 30%, for example  $P = 40\%$   $N = 5,000$  half the width of the confidence is 8.7% and therefore the proportion of the population is in the confidence of 95% between 40 - 8.7 = 31.3% to 40 + 8.7 = 48.7%.

It should be pointed out that for small  $\hat{P}$  the confidence interval given here is symmetrical about the estimate interval. The table was built according to existing tables with the assumption that the sampling variance behaves according to the expression given before.

CHAPTER III. DEFINITIONS AND EXPLANATIONS

- Household - a group of persons present at the time of the census who were living together in the same home, and generally had most of their meals together.
- Type of population - according to the place of residence of the household head before the 1948 war. Households and persons were divided in the sample processings into four categories, as follows:

Outside refugee camps:

- non-refugees - households whose head lived before the 1948 war outside Israel territory;
- refugees - households whose head lived before the 1948 war in Israel territory;
- not-known - place of residence of household heads before the 1948 war is not known, or where it cannot be classified or where the household head was born after that war.

Inside refugee camps: households living inside refugee camps, the majority of whom originates from Israel territory.

On processing, all persons belonging to a household were classified into the same type of population as the head of the household.

3. Facilities

Type of structure - classified according to the material from which the outer walls were made.

- Hard buildings - stones, concrete blocks,
- Clay - walls built of clay,
- Other - all structures whose outer walls were made of cloth, tarpaulin, tin sheets, wood, asbestos; also caves and huts.

Number of rooms - includes living, dining, sleeping and guest rooms as well as the hall and rooms of all tenants included in the household.

Not included are storerooms, kitchens and conveniences.

Average housing density - the number of persons living in a dwelling on the census date, divided by the number of rooms.

Electricity - electric installation in the dwelling (even if there is at present no electric current).

#### Source of water for household use

water tap inside dwelling;  
water tap in yard;  
private water well - well or cistern for the exclusive use of the household;  
public well - well or cistern used by a number of households (even when a fee is charged);  
other - water from a spring, stream or from neighbours, etc.

Bathroom - special separate was room.

For exclusive use of household;  
used jointly with other household(s);  
no bathroom.

Kitchen - special separate room used solely for cooking and the preparation of meals.

For exclusive use of household;  
used jointly with other households;  
no kitchen.

Toilet - the toilet may be for the exclusive use of the household or used jointly with another household and may be either indoors or outdoors. It is considered to be outdoors if the members of the household have to cross an uncovered area to get to it.

#### 4. Household Equipment

Radio - includes radio sets working on alternating current or batteries (transistor radios). A household was considered to have a radio if one was found on the premises.

Television - only sets in residents' homes were included but not in public places (e.g. cafes, hotels, etc.)

Refrigerator - a distinction was made between electric refrigerators and ice-boxes.

#### 5. Assistance

UNRWA Assistance - all households registered with UNRWA (whether receiving food or services or one of the two or merely registered with UNRWA) were considered to be receiving UNRWA assistance.

Assistance from Relatives Abroad - all households which received regular assistance at monthly or quarterly intervals from abroad.

Other Assistance - regular assistance received by household from such agencies as UNICEF, Government welfare bureaux, local religious institutions and the like.

#### 4. Farms and Branches of Agriculture

A farm is defined as a household the head of whom answered at least one of the following questions in the affirmative:

1. Did you grow field crops this year?
2. Did you grow vegetables this year?
3. Have you any plantations?
4. Have you any goats, sheep or cattle?

In these questions no lower limit on the size of the area cultivated or the number of heads of livestock was given, so that the farms also include households which cultivate very small plots. Moreover, farms worked in common by two households were counted twice.

#### 5. Refugees

Households were defined as refugee or non-refugee households according to the settlement in which the head of the households was living in 1948.

#### 6. Geographic Characteristics

Military Government Boundaries. The tables are presented separately for Judaea and Samaria, the Gaza Strip and North Sinai, and the Golan Heights. Where geographic detail is given, a distinction is also made between the Gaza Strip and Northern Sinai.

The totals for the Gaza Strip also include some 2,500 residents of Rafiah who live south of the former international border, in North Sinai.

In North Sinai all settlements along the coastal strip from the boundary of the area near Rafiah down to El Arish were enumerated, but not the nomads in this area.

In the Golan Heights only the inhabited settlements were enumerated, all of which lie in the northern part of this area.

Sub-districts. In Judaea and Samaria, the administrative division by sub-districts was followed, as it existed under Jordanian rule, except in East Jerusalem. In the tables the Ramalla, Bethlehem, Jericho and Jerusalem sub-districts were combined as were the sub-districts of Tulkarem and Jenin.

Geographic Detail. For technical reasons the settlements had to be classified before the census was conducted so that their classification was determined according to the Jordanian Census of 1961 and the Egyptian statistical estimates of 1966 for the Gaza Strip. These data are referred to as "previous sources".

Settlement. A settlement was defined as any place that is permanently settled by 50 persons or more and lies outside the boundaries of another settlement. Places found to be inhabited by fewer than 50 persons were joined with an adjacent settlement. Places inhabited by fewer than 50 persons and not lying within the boundaries of another settlement were included in the sample. In tables showing geographic detail, a distinction was made between urban and rural settlements.

Types of Settlement. Urban settlements are settlements in which according to previous sources there were at least 10,000 inhabitants, including Bet Jalla near Bethlehem, although in the present census fewer than 10,000 inhabitants were counted here, as well as in Kalkilia and in Jericho.

Small villages - settlements with 50-5,000 inhabitants (according to previous sources).

Large villages - settlements with 5,000-10,000 inhabitants according to previous sources, including Araqa, Ya'abed and Abu Dis where fewer than 5,000 inhabitants were enumerated.

Refugee Camps. In all tables except those dealing with farm cultivation no distinction was made between big and small villages whereas refugee camps were considered as a separate type of settlement. In the tables dealing with farm cultivation, a refugee camp was included in the neighbouring settlement.

Nomads and residents of institutions were not included in the sample population.

## 7. Calculation of Percentages

In all tables except those dealing with farm cultivation, percentages were calculated of the total number of persons who answered a given question. In the tables on farm cultivation, percentages were computed of the total population.

| <i>Vegetables</i>                | <i>29</i>   | <i>15,027</i>       |
| Combined with other branches     | 26          | 13,376              |
| Not combined with other branches | 3           | 1,651               |
| <i>Fruit plantations</i>         | <i>68</i>   | <i>34,736</i>       |
| Combined with other branches     | 42          | 21,491              |
| Not combined with other branches | 26          | 13,245              |
| <i>Livestock</i>                 | <i>23</i>   | <i>11,792</i>       |
| Combined with other branches     | 19          | 9,602               |
| Not combined with other branches | 4           | 2,190               |

(a) Excluding 879 households about whom it is not known whether they have own a farm.

Note: The sum of the items exceeds the total because of the farms with more than one branch.

VOLUME 2 TABLE 11

HOUSEHOLDS WITH FARMS, BY  
COMBINATION OF BRANCHES*West Bank*

| Combination of Branches                                 | Percentage | Absolute Numbers |
|---------------------------------------------------------|------------|------------------|
| ALL FARMS                                               | 100        | 51,064 a         |
| <i>One Branch</i>                                       | <i>47</i>  | <i>23,761</i>    |
| Field crops                                             | 13         | 6,675            |
| Vegetables                                              | 3          | 1,651            |
| Fruit plantations                                       | 26         | 13,245           |
| Livestock                                               | 4          | 2,190            |
| <i>2 Branch combination</i>                             | <i>32</i>  | <i>16,430</i>    |
| Field crops - vegetables                                | 54         | 2,670            |
| Field crops - fruit plantations                         | 16         | 8,116            |
| Field crops - livestock                                 | 4          | 1,916            |
| Vegetables - fruit plantations                          | 4          | 2,168            |
| Vegetables - livestock                                  | 0 **       | 225 **           |
| Fruit plantations - livestock                           | 3          | 1,335            |
| <i>3 Branch combination</i>                             | <i>17</i>  | <i>8,727</i>     |
| Field crops - Vegetable - fruit plantations             | 9          | 4,747            |
| Field crops - Vegetable - livestock                     | 2          | 1,001            |
| Field crops - fruit plantations - vegetables            | 5          | 2,560            |
| Vegetables - fruit plantations - live stock             | 1 *        | 419 *            |
| <i>4 Branch combination</i>                             |            |                  |
| Field crops - Vegetable - fruit plantations - livestock | 4          | 2,146            |

Note: Slight difference in the sum of percentages stem from rounding of figures

(a) Including 879 households about whom it is not known whether they have a farm.

\* The cell value is 'subject to high sampling error.'

\*\* The cell value is 'subject to very high sampling error.'

See dataset documentation for details.

\* The cell value is 'subject to high sampling error.'

See dataset documentation for details.

(a) See note (a) to tables 20.

(b) Including households about whose head it is not known if he is a refugee.

DEMOGRAPHIC CHARACTERISTICS  
OF THE POPULATION  
IN THE ADMINISTERED  
TERRITORIES

Data from Sample Enumeration

Jerusalem, 1968

## I N T R O D U C T I O N

The Central Bureau of Statistics is pleased to present to the public another publication on the results of the Census of Population which was conducted by it in September 1967 in the areas administered by the Israel Defence Forces. This publication which is third in the series of the 1967 Census publications, presents for the first time preliminary data on demographic and social subjects: fertility, child mortality, emigration and education. These data were collected from a sample of households simultaneously with the full census. The principal findings are reviewed in the introduction which also contains a description of the methods used for the data collecting, their limitations, definitions of the data and their various classifications. The detailed results are presented in the tables.

I wish to thank all those who have been instrumental in planning and carrying out this census and in publishing its results. The names of those in charge of the various operations were given in the first publication which presented the results of the full enumeration.

Prof. R. Bachi  
The Government Statistician

INTRODUCTION  
AND  
APPENDIX

## INTRODUCTION

### I. MAIN RESULTS

The data contained in this publication are based on a sample census so that they do not agree completely with the full census data published in Publication No. 1 of this series. Explanations of the sampling errors and the evaluation of the statistical significance of the sample data may be found in Chapter II, which also lists other possible errors (response, enumeration and coding errors).

Type of Population: The population of Judaea and Samaria and of Gaza and North Sinai was classified by residence inside or outside refugee camps. Those living in camps were classified into "refugees" and "non-refugees" according to the place of residence of the head of the household before 1948 (see definitions and explanations).

TABLE A. - BREAKDOWN OF HOUSEHOLDS AND PERSONS  
BY TYPE OF POPULATION

| Type of Population            | Judaea and Samaria |         | Gaza and North Sinai |         |
|-------------------------------|--------------------|---------|----------------------|---------|
|                               | Households         | Persons | Households           | Persons |
| <b>Absolute Numbers</b>       |                    |         |                      |         |
| <b>TOTAL</b>                  | 119,153            | 603,383 | 66,821               | 394,424 |
| Outside refugee camps - total | 108,036            | 545,243 | 36,662               | 214,409 |

| Inside refugee camps          | 9.3                | 9.6     | 45.1                 | 45.6    |

(a) The "not known" were proportionally divided over the other categories outside the refugee camps.

The percentages of the population living in refugee camps and of "refugee" families living outside the camps were higher in the Gaza Strip and North Sinai than in Judaea and Samaria, though in both the majority of people living outside the camps were "non-refugees". In Judaea and Samaria their percentage is higher (88 per cent) than in the Gaza Strip and North Sinai (71 per cent). In the population of Judaea and Samaria excluding refugee camps there were more "non-refugees" in the rural settlements (91 per cent) than in the urban settlements (79 per cent). Of the Christian population of Judaea and Samaria 98 per cent was living outside camps (79 per cent non-refugees and 19 per cent refugees) and only 2 per cent in camps.

Marital Status. Most persons of both sexes aged 15 and above were married, with 65 to 70 per cent of the men and 64 to 66 per cent of the women being married, varying with the area. A higher percentage of unmarried was found among men than among women, mainly because of the difference in the age of marriage, while on the other hand there were more widows than widowers.

The distribution of the adult population by marital status depends both on the specific percentages at each age group and on the age structure. Data on the marital status by age and sex are given in Tables 8-10, 35-37 and 58.

Years of Study. The percentage that had attended school, by sex, was about the same in Judaea and Samaria and in the Gaza Strip and North Sinai, but lower in the Golan Heights. Among those who had received schooling the standard of education of both sexes was higher in the Gaza Strip and North Sinai than in Judaea and Samaria and still more so than in the Golan Heights.

TABLE B. - PERCENTAGE ATTENDED SCHOOLS, BY AREA,  
NUMBER OF YEARS OF STUDY AND SEX

|                                                        | Judaea and Samaria |       | Gaza Strip and North Sinai |       | Golan Heights |       |
|--------------------------------------------------------|--------------------|-------|----------------------------|-------|---------------|-------|

| <b>TOTAL</b>                                           | 100.0              | 100.0 | 100.0                      | 100.0 | 100.0         | 100.0 |
| 1 - 4                                                  | 26.1               | 26.8  | 19.1                       | 19.3  | 35.3          | 62.8  |
| 5 - 8                                                  | 42.9               | 48.1  | 33.5                       | 37.2  | 44.3          | 34.5  |
| 9+                                                     | 31.0               | 25.1  | 47.4                       | 43.5  | 20.4          | 2.7   |

In Judaea and Samaria the standard of education of both sexes was highest in the towns, and lowest in the rural settlements with the refugee camps being in between. In the Gaza Strip and North Sinai, the standard of education of the inhabitants of refugee camps - most of them big camps located in or near the towns - was about the same as of the remaining inhabitants. The Christians were found to have a higher standard of education than the Moslems.

Place of Residence Before the 1948 War. Of the population aged 21 and above for which relevant data are available, 21 per cent in Judaea and Samaria and 57 per cent in the Gaza Strip and North Sinai were living in Israel territory before the 1948 War. Their proportion was much higher in families where the head of the household is a refugee and among the refugee camps population, although in both these categories a certain percentage reported that they had been living outside Israel territory (9 per cent of respondents in the refugee camps of Gaza and 15 per cent in the refugee camps of Judaea and Samaria).

Sons/daughters living outside the territories administered by Israel: Thirty three per cent of households in Judaea and Samaria and 24 per cent of households in the Gaza Strip and North Sinai reported that there were sons and daughters of the head of the household living during the Census outside the areas administered by Israel - (for the sake of brevity referred to as living abroad). In about half these households there were two or more sons or daughters abroad, and they numbered 77,500 in Judaea and Samaria and 27,700 in the Gaza Strip and North Sinai. By type of population there were no big differences in the percentage of households with sons/daughters abroad. Between 21 to 33 per cent of the sons/daughters abroad (varying with the type of population and the area) departed during the year preceding the census, but the majority had left before the Six Day war.

The majority of sons/daughters abroad were reported to be living in Arab countries but while 41 per cent of those who had left Judaea and Samaria were reported to be in Jordan, 56 per cent of the emigrants from the Gaza Strip and North Sinai were living in Egypt.

Fertility: A very high fertility rate varying but slightly with different demographic characteristics is typical for all the three areas and in that respect is very similar to the non-Jewish population in Israel. Non-single women aged 45-49, i.e. at the end of their child-bearing period, were found to have had an average of 8.6 live births in Judaea and Samaria and 8.3 and 7.0 live births in the Gaza Strip and North Sinai and the Golan Heights, respectively. The average was still higher for women who were married at the time of the census, but somewhat lower for divorced and widowed. In Judaea and Samaria which have a considerable Christian population it could be noted that the fertility rate of Moslems was higher than of Christians but no

systematic differences could be established by type of population and of settlement though to some extent an inverse ratio was found between standard of education and fertility. Where in the older age groups a smaller number of children was reported than by women aged 45-49 this is probably due to the fact that these older women omitted to mention some of the children they have had. In Judaea and Samaria 32 per cent and in the Gaza Strip and North Sinai 31 per cent of non-single women aged 45-49 reported 11 or more children each.

Child mortality. The census also included questions regarding the number of children borne to non-single women (aged 15-60) during the past 5 years and how many of them died in the meantime. Although it is doubtful whether in their replies the women adhered to the strict time limit, the data so obtained are sufficient for a fair estimate of child mortality.

In Judaea and Samaria 21 per cent of these children were found to have died, and in the Gaza Strip and North Sinai and in the Golan Heights 22 and 16 per cent, respectively. The type of population did not seem to have any major effect on these percentages, and altogether child mortality was found to be over three times as high as among the non-Jewish population of Israel. The mortality rate was slightly higher with very young women and with women close to the end of their childbearing period.

## II. ORGANIZATION OF THE CENSUS AND LIMITATIONS OF THE RESULTS

The data of this publication were collected in the course of the Census of Population 1967, conducted in the territories administered by the Israel Defence Forces. The census procedures and its organization were outlined in publication No. 1 in this series.

The questions relating to the topics dealt with in the present publication were contained in a supplementary detailed questionnaire used for a sample of 20 per cent of all households (Stage B questionnaire) in addition to the general Stage A questionnaire which was filled in for the whole population and contained only basic demographic particulars.

From the sample data estimates were drawn up for the entire population according to the method described below.

### 1. The Population

The data in this publication relate to all persons in households in the administered areas on the census date, except the population living in institutions and nomads.

### 2. The Survey Unit

For the characteristics, which are the subject of the present publication each household was considered as a survey unit, consisting of those persons present at the time of the Census, living in the same dwelling unit and having most of their meals together.

### 3. Method of Enquiry

The data were obtained by interviewing the households in their homes. Enumerators called on all households included in the sample and filled in a Stage B questionnaire immediately after the completion of the Stage A questionnaire (except in the Golan Heights where the Stage B questionnaire was filled in for the entire population about two weeks after the general Stage A of the Census was taken). A copy of the Stage B questionnaire is shown in the Appendix.

### 4. Sampling Method

As noted, the characteristics of the population presented in this publication were collected for a representative 20 per cent sample of the households in Judaea and Samaria, the Gaza Strip and North Sinai.

The buildings in which the population of the area resided were mapped before the Census and divided into "Enumeration Districts", with an average of 55 households in each(a). The sample was a sample of enumeration districts (cluster sample), drawn systematically from geographical strata. Although this method introduced a certain clustering which lessened the precision of the estimates, it was, nevertheless, simpler and more convenient from an organizational point of view. The specific conditions under which the Census was conducted (in one day, under curfew conditions and with the enumerators working in teams, etc.) prevented taking an unclustered sample.

### 5. Field Work

About 750 special enumerators (Stage B enumerators) carried out the Census in the sample enumeration districts (Stage B districts). For this purpose enumerators of a higher standard and with a better knowledge of Arabic were chosen. They received 10-12 hours comprehensive instructions and training before going in the field (compared with only 4 hours for Stage A enumerators).

The field work was carried out in teams. Each team of Stage B enumerators was composed of 4-6 enumerators and was responsible for one Stage B enumeration district. A special Stage B crew-leader was in charge of one or two teams.

The filled-in questionnaires were handed in during the day to a field office in charge of 3-4 crew-leaders (of whom 1 or 2 were Stage B supervisors) where they were first edited by a special editor of each field office. Special care was taken in editing the Stage B questionnaires and as a result further enquiries were made or corrections introduced whenever required.

- 
- (a) In the Golan Heights a detailed questionnaire was filled in for all households while in one "region" in Judaea and Samaria the Stage B questionnaire was filled in for a sample for only 15 per cent of the enumeration districts because of a shortage of personnel.

This was followed in the Jerusalem Office of the Central Bureau of Statistics by further editing during the coding. The coded questionnaires were punched on punch-cards with one for each household and one for every person aged 15 years and above. A computer edit-check was then carried out and logical inconsistencies were corrected according to predetermined instructions. The material was then processed to a set of standard tables on an IBM 360/30 computer at the Office Mechanization Centre.

## 6. Method of Estimation

In order to obtain estimates for the total population from the sample surveyed, the data had to be multiplied by a suitable raising factor. Although approximately one fifth of the enumeration districts were selected for Stage B enumeration, this factor was usually higher than 5 because of:

- a. variations in the size of the enumeration districts;
- b. field-work errors, Stage B questionnaires not being filled in for part or whole of an enumeration district included in the sample or being filled in for enumeration districts not designated to be sampled;
- c. non-inclusion of the Stage B characteristics in the supplementary enumeration conducted after the full census.

For the sake of statistical accuracy a different raising factor was therefore used for different groups of enumeration districts or inflation categories, as follows:

### a) Population outside refugee camps

- (1) Towns - each town separately
- (2) Urban settlements - by districts in the "census region"
- (3) Rural settlements - by sub-districts in the "census region"

### b) Population in refugee camps

- (1) Gaza Strip and North Sinai - in the towns, every refugee quarter was considered as a separate inflation category while the remaining refugee camps in the region constituted one inflation category.
- (2) Judaea and Samaria - all refugee camps in each "census region" constituted one inflation category.

The inflation factor F was determined as follows for each inflation category:

$$F = \frac{\text{total number of persons aged 15 years and above in Stage A}^{(a)}}{\text{total number of persons aged 15 years and above in Stage B}}$$

In this way it was intended that all estimates for adults aged 15 years and above in a tabulation for one or several inflation categories should correspond to the full census population. Nevertheless, the number of persons and household in Stage A and B does not fully coincide owing to sampling errors and differences in investigation and processing methods which led to a slight difference between Stage A and Stage B in the average number of adults per household(b).

The total number of persons in Judaea and Samaria, according to Stage A of the Census, was 594,089, in the Gaza Strip and North Sinai 377,307 and in the Golan Heights 6,396 while the respective figures obtained according to Stage B were 603,378, 394,433 and 6,312.

It should further be noted that in the Gaza Strip the classification of the urban population included in the supplementary census registration as regards residence inside or outside refugee camps, was faulty. This error was not corrected in the tabulation of the basic questions but an effort was made to correct it in the tabulation of the detailed data. Hence the total of refugee camp residents in the two tabulations is not identical (the correction was, however, made for Rafiah, Khan Yunis and Deir el Balah.

## 7. Limitations of the Figures

Like any statistical activity, the results of this Census are also subject to a number of limitations:

- a. Response errors and errors of processing - these errors result from inaccurate replies and from errors in recording, coding, punching, or processing. It should be noted that a part of these errors tend to cancel each other in the totals.

- (a) Including those enumerated in the supplementary registration apart from residents of institutions and nomads.
- (b) See Census of Population 1967, Publication No. 1, pp. XXX-XXXII. The difference between Stage A and B in the Golan Heights is due not to sampling errors but to the time interval between the two stages.

b. Errors resulting from the sampling:

- (1) Biases due to the fact that the household sample and the households actually investigated and processed were not fully identical because of defects in implementing the sample and because the population included in the supplementary registration was not investigated in Stage B. When the data were processed the sample characteristics for each strata were imputed also to the population not directly represented by means of a proportional estimate; this, however, led to certain minor biases, for instance, regarding estimates of households and total population.
- (2) Sampling errors: The estimates suffer also from errors that result from the fact that the survey was based on a sample and not on a complete census of all households. As the sample included some 20,000 households in Judaea and Samaria and about 11,000 in the Gaza Strip and North Sinai, the sampling errors are very small for estimates referring to large groups (e.g. total population) and to common occurrences. On the other hand, as the estimates refer to smaller geographical groups (e.g. individual settlements) or to rarer occurrences, the effect of the sampling errors increases.

For lack of time, exact estimates of the sampling errors have not yet been drawn up. Only very rough estimates were made in order to caution the reader in respect of estimates for which the sampling error might be considerable.

Presentation of the Data

The following rules were followed in the presentation of the data:

- a. Whenever the relative sampling error was less than 30 per cent the data are shown as such;
- b. when the relative sampling error was in the range of 30-50 per cent the figures were placed in parentheses;
- c. when the sampling error exceeded 50 per cent the figure was enclosed in double parentheses.

CONFIDENCE INTERVAL OF 95 PERCENT FOR VARIOUS VALUES OF  $\hat{P}$  AND  $\hat{n}$  APPLYING TO HOUSEHOLDS AND AGE GROUPS OF WOMEN

| Estimate of the Total Population of Households and Age Groups of Women by No. of Table of Stage B Census |           |           |           | $\hat{P}$ Estimate of Percentage |         |          |          |           |           |                   |

| 22,500                                                                                                   | 30,000    | 39,000    | 55,500    | 0.5-1.7                          | 1.4-2.9 | 3.8- 6.4 | 8.4-11.8 | 17.8-22.4 | 27.3-32.7 | $\hat{P} \pm 2.8$ |
| 45,000                                                                                                   | 60,000    | 78,000    | 111,000   | 0.6-1.5                          | 1.5-2.6 | 4.2- 5.9 | 8.8-11.3 | 18.4-21.6 | 28.1-31.9 | $\hat{P} \pm 2.0$ |
| 77,500                                                                                                   | 90,000    | 117,000   | 166,000   | 0.7-1.4                          | 1.5-2.5 | 4.3- 5.7 | 9.0-11.0 | 18.7-21.4 | 28.4-31.6 | $\hat{P} \pm 1.6$ |
| 90,000                                                                                                   | 120,000   | 156,000   | 222,000   | 0.7-1.3                          | 1.6-2.5 | 4.4- 5.6 | 9.2-10.9 | 18.9-21.2 | 28.6-31.4 | $\hat{P} \pm 1.4$ |

Note: For values of  $\hat{P}$  50% the confidence interval for  $\hat{Q} = 1 - \hat{P}$  can be obtained from the above table.

Confidence Intervals

A 95 per cent confidence interval for the estimate of proportion P gives the range within which that proportion would have been obtained in a full census at a confidence level of 95 per cent. Confidence intervals have been calculated for most of the tables in order to help the reader evaluate the statistical significance of the data material. Non-sampling errors were not taken into account in this calculation. Thus confidence intervals are shown for all tables relating to households and to women by age groups, from which the confidence intervals for the remaining tables were determined.

Use of the Confidence Interval Table

The calculation of the 95 per cent confidence level is based on the variables  $\hat{N}$  and  $\hat{P}$  where  $\hat{N}$  is the estimated total of households or of women in the various age groups and  $\hat{P}$  is the estimated proportion as defined above.

1) Example a

In Table No. 22 Judaea and Samaria showing the distribution of households by the number of sons or daughters staying outside the areas held by Israel, the total number of households in Hebron is 7,080 and the total number of households with a son or daughter staying abroad is 960, so that 13.6 per cent of all households in Hebron have a son or daughter abroad. The confidence interval for the percentage of Hebronite households with a son or daughter staying abroad is obtained as follows:

Let us look at column 3 (where Table No. 22 is listed). Since the total number of households in Hebron is 7,080, the closest  $\hat{N}$  is that for 7,800. Since  $\hat{P} = 13.6$  per cent and there is no figure indicated for this percentage, let us look at the extremes of the confidence interval for  $\hat{P} = 10$  per cent and  $\hat{N} = 7,800$  which are 6.5 and 14.6 per cent and add 3.6 per cent to both, i.e. the difference between  $\hat{P} = 13.6$  per cent and  $\hat{P} = 10$  per cent. Hence the percentage of Hebronite households with a son or daughter staying abroad may be set at between 11.1 and 18.2 per cent at a confidence level of 95 per cent. Wherever absolute numbers are shown, the corresponding percentages must first be calculated or looked up in the appropriate table and according to it the confidence intervals can be obtained.

Example b

Table 23, which is listed in column 1 (Judaea and Samaria), shows all non-single women aged 15-60 by type of population, family status,

age and the average number of children borne. The total number of women is 105,337 and of women aged 15-19 - 4,495. This age group thus constitutes 4.3 per cent of the total. To determine the confidence interval for this estimate of percentage of women aged 15+ of the total, let us look at Column No. 1. The  $\hat{N}$  closest to 105,337 is 90,000. Therefore this value should be taken in order to determine the right value of the confidence interval. Since  $\hat{P} = 4.3$  per cent, which is not shown in the table, let us look at the extreme values of the confidence interval for  $\hat{P} = 5$  per cent and  $\hat{N} = 90,000$  which are 4.4 and 5.6 per cent, deducting 0.7 per cent - the difference between  $\hat{P} = 5$  per cent and  $\hat{P} = 4.3$  per cent from each side. Accordingly the percentage of women aged 15-19 is between 3.7 and 4.9 per cent at a confidence level of 95 per cent.

2) Other Tables (for which confidence intervals are shown)

In these tables the corresponding N must be taken from another table, as indicated below, consulting the appropriate column.

REFERENCE TABLE FOR JUDAEA AND SAMARIA AND THE GAZA STRIP

| No. of Table       | No. of the Table<br>Containing the Appropriate $\hat{N}$ |
|--------------------|----------------------------------------------------------|
| Judaea and Samaria |                                                          |
| 20, 21             | 19                                                       |
| 6, 7, 8, 15        | 4                                                        |
| 12                 | 5                                                        |
| 1, 11, 14, 16      | 2                                                        |
| 24, 25, 26         | 23                                                       |
| Gaza Strip         |                                                          |
| 47, 48             | 46                                                       |
| 33, 34, 42         | 31                                                       |
| 39                 | 32                                                       |
| 51, 52, 53         | 50                                                       |

### Examples

a) In Table 6 (Judaea and Samaria) relating to the number of persons aged 15 and above by type of population and age, the total number of "refugees" is 63,517, of whom 20 per cent are in the 15-29 age group. The appropriate  $\hat{N}$  is determined from Table 4 (households) appearing in column 4, as follows: The total number of refugee households is 11,909 so that the corresponding  $\hat{N}$  in column 4 is 11,110 which is the closest to 11,909. The confidence interval for the percentage of refugees aged 15-29 therefore lies between the extremes 15.2 and 25.7 per cent.

b) In Table 39 (Gaza Strip) relating to persons aged 15 years and above by type of population, sex and relationship to the head of the household, the total number of persons aged 15 and above who are "non-refugees" is 70,652, of whom 32,517 or 46.0 per cent are men. The appropriate  $\hat{N}$  must be taken from Table 32, where the total number of "non-refugee" households is 24,159, so that the corresponding  $\hat{N}$  in column 1 is 22,500. Since  $\hat{P} = 46$  per cent, the last column of the table should be consulted, so that the appropriate confidence interval is  $(46.0 \pm 2.8)$  per cent. Accordingly the percentage of "non-refugee" men in the Gaza Strip is within the range of 43.2 and 48.8 per cent at a confidence level of 95 per cent.

### III. DEFINITIONS AND EXPLANATIONS

#### a. Demographic Characteristics

1. Census date: In the Golan Heights the Stage A Census was conducted on 10 August 1967 and the Stage B census on 15 August 1967. In the Gaza Strip and North Sinai the Census was carried out between 10 and 14 September and in Judaea and Samaria between 17 and 25 September.

Census Population: The census population consisted of all persons whose presence was actually checked in the course of the house to house census and does not include persons who were absent from their homes unless they had a special permit to that effect.

Type of Residence: By type of residence the population was divided into two groups: persons living in households and persons living in institutions. In the sample census dealt with in this publication only the population living in households was included.

Household: A household was defined as a group of persons who shared the same home and were in the habit of having most of their meals together, including guests present at the time of the census.

Total Number of Persons, Number of Persons aged 15 and above per household -  
In the sample data the number of household members aged 15 years and above was determined according to the sample questionnaire while the total number of household members was transferred from the full census questionnaire. The number of persons aged 0-14 in the sample data was established by deducting the adult population aged 15 years and above from the total population.

Religion: Household members were classified according to the religion of the head of the household as reported by him.

Type of Population: Both households and persons were classified into four groups according to the place of residence of the head of the household before 1948:

Outside the refugee camps:

"Non-refugees" - households whose head was living  
outside Israel territory before the 1948 war;

"Refugees" - households whose heads were living in Israel territory before the 1948 war;

"Not known" - households where the place of residence of the head of the household before the 1948 war was not known, or could not be classified (ascertained) or where the head of the household was born after the 1948 war.

Inside refugee camps - households living in refugee camps, most but not all originating from Israel territory.

All household members were classified according to the same population type as the head of the household.

Personal Place of Residence Before the 1948 War - In the "personal sample questionnaire" information was obtained about the former place of residence - before the 1948 war - of every person aged 15 years and above (see questions 8,9 in the Stage B questionnaire). The replies were classified as follows:

Born in the present place of residence

Aged 21+ years

Aged 15-20 years, head of household "non-refugee"

Aged 15-20 years, head of household "refugee"

Aged 15-20 years - status of head of household not known

Living in present place of residence over 21 years

Living in present place of residence less than 21 years;

Aged 21+ years - living outside Israel territory in 1948

Aged 21+ years - living in Israel territory in 1948

Place of residence in 1948 not known

Aged 15-20 years, head of household - "non-refugee"

Aged 15-20 years, head of household - "refugee"

Aged 15-20 years - not known whether head of household is a refugee.

Age - The instructions required that the age should be determined according to the respondent's last birthday but there may have been a mis-statement of ages, especially of women and older people.

Relationship to Head of Household: This relationship was determined according to the classification appearing in question 6 of the "personal sample questionnaire". The data are given only for persons aged 15 years and above. That person whom the members of the household stated to be the head of the family, was considered as such.

Number of Years of Study: According to the instructions issued, the relevant question related to all the years the respondent had attended different schools, regardless of what type, including kuttab (Moslem religious school), elementary school, high school, vocational school, teachers training college, religious seminary, university, etc. Not included were courses, correspondence courses, private lessons and autodidactic studies. Only full years of schooling were recorded and parts of years were rounded off. The question referred to the number of years the respondent had attended school and not the grade attained. If he spent two years in the same grade, this was put down as two years of schooling.

#### Sons/Daughters of the Head of the Household Staying Outside the Territories

Administered by Israel: All heads of households were asked whether they had any sons or daughters staying outside the territories administered by I.D.F. and if the answer was in the affirmative - how many years ago each of them had left, and where he/or she was staying at the time of the census.

Fertility: Non-single women, aged 15-60 (the age 60 was included in view of the tendency to round off ages) were asked how many live births they had had, how many children they had borne during their lifetime even if they had died in the meantime, but not including miscarriages and stillbirths. Additional data on female fertility were obtained by means of the questions relating to the children borne during the 5 years preceding the census (questions 11,12 of the personal sample questionnaire, see photostat).

Mortality of Children Below the Age of 5 - Non-single women, aged 15-60 were asked how many children they had borne in the last five years that were still alive and how many of them had died in the meantime. By combining the answers to these two questions, the total number of children born in the 5 years preceding the census and the percentage who had died. Though it can hardly be assumed that the women adhered strictly to the 5-year time limit, the main purpose of the question was to ascertain the relative incidence of child mortality.

#### b. Geographic Characteristics

Boundaries of the Military Administration: Separate tables are presented for Judaea and Samaria, for the Gaza Strip and North Sinai and for the Golan Heights. The Gaza Strip tables include some 2,500 residents of Rafah living south of the former international border with North Sinai. In North Sinai only the settlements along the coastal strip, from the border near Rafah down to and including El Arish, were enumerated, but not the nomads roaming this area. In the Golan Heights the census covered all currently inhabited settlements lying in the Northern part of this territory.

Sub-Districts: The division into sub-districts was made according to the administrative division in force under Jordanian rule.

Settlement: Any place inhabited permanently by at least 50 persons present at the time of the census and lying outside the boundaries of another settlement was regarded as a settlement (locality).

Types of Settlement: For technical reasons the settlements had to be classified before the census was taken so that the type of the various settlements was determined according to the 1961 census conducted by the Kingdom of Jordan and the statistical estimates drawn up by the Egyptian Governor of the Gaza Strip in 1966. These will be referred to as "previous sources". In the processing of the sample data a simplified classification was used. The more detailed classification is set out in Publication No. 1 of the 1967 Census Series.

Urban Settlements: Settlements which according to the previous sources had at least 10,000 inhabitants.

In the census less than 10,000 inhabitants were found in Beit Jala, Qalqiliya and Jericho. The data relating to urban settlements do not include the refugee camps located there.

Rural Settlements: Settlements which according to the previous sources had less than 10,000 inhabitants, not including refugee camps. Nomads and persons living outside the settlement boundaries were included in the rural settlements.

Refugee Camps: This category includes both refugee camps located inside urban settlements and other refugee camps, and comprises UNRWA camps as well as the camps in Wadi Far'a and in the Jordan Valley.

## INTRODUCTION

## CHAPTER I. - MAIN FINDINGS

## GENERAL

Presented below are the preliminary data concerning the characteristics of the population's labour force and the occupational and branch composition of the employed. These data were collected in the administered areas during Stage B of the Census of Population and Housing - September 1967. This stage of the census is based on the investigation of a representative sample comprising 20 per cent of the population. The inquiry into this subject concentrated mainly on the employment of the present population "after the war" (during the week preceding the census) as compared with the employment situation "before the war" (prior to June 1967). The data in this publication were assembled for each of the regions: Judaea and Samaria, the Gaza Strip and North Sinai; and for each population group: (a) residents or refugee camps and those living outside the camps, refugees and non-refugees.

It should be mentioned that:

- (a) living inside refugee camps is a small group of residents that are not refugees according to the definition<sup>(a)</sup>;
- (b) among those residing outside the camps is a group of about 5 per cent from households in Judaea and Samaria and 3 per cent from households in the Gaza Strip and North Sinai the type of population is not known.

Since the data of Stage B of the census are based on a sample, sampling errors are inevitable. Explanation as to the sampling errors and the system used to aid the reader in evaluating the statistical meaning of the data are given in chapter B. Other errors, from which no census is free, are response errors, errors made by the enumerator, errors in coding, etc. For details of these types of errors see publication No. 1, of this publications series.

---

(a) A refugee was defined according to the location of the head of the household in 1948. See chapter on definitions below.

For particulars on the organization of the census and enumeration system, see publications 1 and 2 of the 1967 census publication.

## JUDAEA AND SAMARIA

### 1. General

#### 1.1 Population at Working Age

Residing in Judaea and Samaria at the time of the census (September, 1967) was a population of 603,400 (according to Stage "B" (a), which is 119,200 households. 141,000 men of this population were of working age (15 years of age and over) as were 164,000 women. Analysis of their employment relates mainly to the male population (as far as tabulations by sex were received). Because of the difficulty in determining female employment in agricultural countries (where work on the farm is considered by the women to be a household chore and therefore is not reported as "work") the rates of female employment were low and will not be reflected in this publication.

#### 1.2 Employment Before the War

(b) Of the 141,000 men of working age in September 1967, some 84,500 worked before the war of June 1967 (representing about 60 per cent of the men in working-age). If to this is added approximately 7,000 work-seekers (5 per cent of the labour force - a rate equivalent to that found by the Jordanian census of 1961), a gross estimate of about 97,500 will be reached for the potential civilian labour force. This is 65 per cent of the entire population of men at working age (as compared with approximately 75 per cent<sup>(a)</sup> reached by the Jordanian census of 1961, which included Eastern Jerusalem).

- (a) The data of Stage "B" were inflated according to the mature population (15+ years of age) as stated in publication No. 2. Thus the discrepancy in overall population between Stages A and B of the census.
- (b) Approximately 3,000 men, about whom it was not known whether they had worked before the war, were divided proportionately between the employed and the unemployed.
- (c) Data on the number of employed according to the Jordanian census of 1961 included the army in the labour force. Thus, if approximately 15,000 army personnel are deducted, a 68 per cent rate of participation in the civilian labour force will be attained, which is similar to that recorded by the Israeli census.

Age. The division of men who worked before the war according to age is as follows:

TABLE A.- MEN AGED 15+ WHO WORKED BEFORE THE WAR, BY AGE

| Age                   | 15-24  | 25-34  | 35-44  | 45-54  | 55-64  | 65+    |
|-----------------------|--------|--------|--------|--------|--------|--------|
| TOTAL                 | 40,488 | 23,707 | 21,999 | 15,740 | 15,591 | 20,474 |
| Worked before the war | 16,700 | 20,630 | 19,046 | 12,581 | 9,505  | 6,057  |
| % of men who worked   | 41.2   | 87.0   | 86.6   | 79.9   | 61.0   | 29.6   |

### Education

The percentage of men with nine or more years of study who worked before the war was lower than that of working men with less education. For example: 58 per cent of the men with no education (0 years of study) worked before the war in comparison to 42 per cent of men who worked from among the group that had completed nine or more years of study. A combination of the variables - age and education reveals that the 15-24 age-group comprises 65 per cent of the 9+ years of study group. This means that the low percentage of men that were found to have worked before the war in the 9+ years of study group is explained by the young age-composition of the group.

TABLE B.- MEN AGED 15+ WHO WORKED BEFORE THE WAR, BY YEARS OF STUDY

| Years of Study        | 0      | 1-4    | 5-8    | 9+     |
|-----------------------|--------|--------|--------|--------|
| TOTAL                 | 51,448 | 23,087 | 37,941 | 27,451 |
| Worked before the war | 29,754 | 17,846 | 26,390 | 11,626 |
| % of men who worked   | 57.8   | 77.3   | 69.6   | 42.4   |

### 1.3 Employment After the War

Some 51,900 of the men of working age stated that they had been working after the war and that another 7,000 maintained jobs from which they were absent<sup>(a)</sup>, so that the total number of "employed" was 58,900 men (constituting 41.8 per cent of the men of working age).

Of the 81,900 men who were unemployed after the war (from September), 7,100 sought work during the week prior to the census, 27,200 stated that they had not sought work because "it wasn't worthwhile - there is no work" (18,000 of these had worked before the war), 16,400 were pupils, 5,900 lived of their property, and 20,500 were dependants, pensioners, elderly, or sick.

### 1.4 Comparison of Pre- and Post-war Employment

1.4.1 The number of employed after the war was 30 per cent (25,600 men) lower than the equivalent number before the war. In evaluating the number of employed after the war, the following factors must be taken into consideration:

A. The data relate to September 1967 and therefore, (1) the discrepancy in employment before and after the war could be influenced by the seasonal slack in agricultural employment in September, (2) the schools had not yet re-opened, and part of the teaching staff most likely stated that they were unemployed or did not belong to the labour force.

B. The volume of public works, commerce, and industry has increased since September and it is, therefore, justifiable to assume that the unemployment rate tended to diminish after that month.

1.4.2 About 58 per cent of the males employed before the war continued working in September<sup>(b)</sup>. The distribution according to education shows a continuous increase in the percentage of workers after the war from among those employed before the war, corresponding to the increase in

- (a) A person was defined as being absent from work if he neither worked nor sought work during the week prior to the census because he expected to return to a former place of work.
- (b) Included herein are only those that were actually working during the week preceding the census; excluded are the males who were absent from work during the week prior to the census and those that were employed after the war but unemployed previously.

education level up to the education-group with 8 years of study. The percentage of those continuing to work among the males belonging to the education-group with 9+ years of study declined somewhat. This group includes academicians, and it may be assumed that a small percentage of them has continued working after the war.

TABLE C.- PERCENTAGE OF MEN WHO WORKED AFTER THE WAR FROM AMONG THOSE WHO WORKED BEFORE THE WAR, BY YEARS OF STUDY

| Years of study                                                                   | Total | 0    | 1-4  | 5-8  | 9+   |
|----------------------------------------------------------------------------------|-------|------|------|------|------|
| Percentage of men who worked after the war from among those who worked before it | 58.0  | 53.6 | 56.4 | 63.1 | 59.6 |

### 1.5 Composition of the Men who Worked Before and After the War, by Occupation

About 34 per cent of those working before the war were farmers, fishermen, and the like. Construction workers constituted 19 per cent, artisans and other industrial workers - 15 per cent and merchants, agents, and salesmen - 14 per cent. Each of the remaining occupations accounted for 4-6 per cent of those who had worked before the war. A comparison of the distribution of occupations preceding and following the war points to a marked decrease in most occupations except merchants and service-workers as is shown in the following table:

TABLE D.- MEN WHO WORKED BEFORE AND AFTER THE WAR,  
BY OCCUPATION

|                    | Total  | Professi-<br>onal<br>workers | Mana-<br>gerial<br>and<br>clerical<br>workers | Traders,<br>agents<br>and<br>salesmen | Farmers,<br>fisher-<br>men and<br>related<br>workers | Transport<br>and<br>communica-<br>tions<br>workers | Construc-<br>tion<br>workers | Craftsmen,<br>industrial<br>and<br>related<br>workers | Services<br>workers |
|--------------------|--------|------------------------------|-----------------------------------------------|---------------------------------------|------------------------------------------------------|----------------------------------------------------|------------------------------|-------------------------------------------------------|---------------------|
| Before war         | 51,897 | 1,939                        | 2,281                                         | 7,626                                 | 17,301                                               | 2,328                                              | 6,797                        | 6,582                                                 | 4,215               |
| After war          | 82,658 | 4,067                        | 3,717                                         | 8,988                                 | 27,517                                               | 3,965                                              | 14,837                       | 12,099                                                | 5,251               |
| % of de-<br>crease | 37.2   | 52.3                         | 15.2                                          | 15.2                                  | 37.1                                                 | 41.3                                               | 54.2                         | 45.6                                                  | 19.7                |

TABLE E.- DISTRIBUTION OF MEN, BY OCCUPATION BEFORE THE WAR,  
ACCORDING TO THE 1967 POPULATION CENSUS AND THE  
1961 JORDANIAN CENSUS

| Occupation                           | Total | Professi-<br>onal<br>technical<br>and<br>related<br>workers | Mana-<br>gerial<br>and<br>clerical<br>workers | Traders<br>and<br>agents | Farmers,<br>fisher-<br>men and<br>related<br>workers | Transport<br>and<br>communica-<br>tions<br>workers | Quarry and<br>mine wor-<br>kers, crafts-<br>men, const-<br>ruction and<br>industrial<br>workers | Services,<br>sport and<br>entertain-<br>ment<br>workers |
|--------------------------------------|-------|-------------------------------------------------------------|-----------------------------------------------|--------------------------|------------------------------------------------------|----------------------------------------------------|-------------------------------------------------------------------------------------------------|---------------------------------------------------------|
| 1961 Jorda-<br>nian census           | 100.0 | 3.9                                                         | 4.1                                           | 8.3                      | 38.3                                                 | 4.8                                                | 34.8                                                                                            | 5.8                                                     |
| 1967 Census<br>Pre-war<br>occupation | 100.0 | 5.1                                                         | 4.6                                           | 11.2                     | 34.2                                                 | 4.9                                                | 33.5                                                                                            | 6.5                                                     |

The distribution of occupations in Judaea and Samaria in 1961 according to the Jordanian census resembles the distribution of occupations before the war found in the 1967 population census - see Table E.

#### 1.6 Pre- and Post-war Composition of Employed, by Economic Branch

Some 35 per cent of the males working prior to the war were employed in agriculture, 16 per cent in industry and services, 13 per cent in commerce, 7 per cent in transportation and 1 per cent in electricity, water, and sanitary services.

This composition remained almost unchanged after the war (see table 4). The average number of work-days per worker per week (males and females) after the war was reported to be 5.3. The distribution of the average number of days per worker in each economic branch is shown in Table F.

#### 1.7 Status at Work After the War

Employees numbered 22,900 after the war, constituting 46 percent of all those employed (21 per cent were employed on a monthly basis, 5 per cent on a weekly basis, and 20 per cent on a daily basis). About 45 per cent of those working were self-employed.

#### 1.8 Male Employees and Wages Before the War

The number of pre-war employees who reported their income reached 41,400. Their average monthly wage was 24.7 Dinars. The highest average monthly wage was registered in the services-branch - 30.4 dinars, the lowest - in the agricultural branch - 18.0 Dinars (see Table G).

#### 2. Type of Population

According to Stage B of the census, about 58,100 people constituting 11,000 households resided in the refugee camps. Another 63,500 refugees (or 12,000 households) were found to be living outside the camps together with 453,300 people (89,600 households) not defined as refugees.

TABLE F.- AVERAGE NUMBER OF DAYS PER WORKER PER WEEK, BY ECONOMIC BRANCH (Men and Women)

| Economic Branch                | Total | Agriculture, forestry and fishing | Industry and crafts-manship | Construction and public works | Electricity, water and sanitary services | Commerce, banking and insurance | Transport, freight storage and communication | Public Services |
|--------------------------------|-------|-----------------------------------|-----------------------------|-------------------------------|------------------------------------------|---------------------------------|----------------------------------------------|-----------------|
| Average no. of days per worker | 5.3   | 5.2                               | 5.4                         | 5.1                           | 5.9                                      | 5.9                             | 5.5                                          | 6.0             |

TABLE G.- AVERAGE WAGE OF MALE EMPLOYEES, BY ECONOMIC BRANCH BEFORE THE WAR

| Economic Branch                | Total | Agriculture, forestry and fishing | Quarries, mines and industry | Construction and public works | Electricity, water and sanitation | Commerce, banking and insurance | Transport, storage and communication | Services |
|--------------------------------|-------|-----------------------------------|------------------------------|-------------------------------|-----------------------------------|---------------------------------|--------------------------------------|----------|
| Average monthly wage in Dinars | 24.7  | 18.0                              | 23.8                         | 23.3                          | 20.2                              | 27.0                            | 26.4                                 | 30.4     |

## 2.1 Employment Before and After the War

About 13,000 of the total number of men in the refugee camps were at working age. 7,800, or 57 per cent, had worked before the war and 4,800 were working following the war, who, together with an additional 600 men temporarily absent from work brought the entire number of those who worked after the war to 5,400 or 40 per cent of the men at working age.

The refugee population living outside the camps included 15,200 men, 8,900 (59 per cent) of whom had been working before the war. 5,500 were found to have worked after the war plus 800 temporarily absent from work bringing the total employed to 6,300 or 41 per cent of men at work age. The population not defined as refugees included 105,400 males of working age, of whom 62,200 (59 per cent) had been employed before the war. 39,200 were actually found to be working after the war, plus another 5,200 men who were temporarily absent from work, bringing the total number of employed after the war to 44,400 (42 per cent). The rate of decrease in employment registered after the war for the refugees was similar to that registered for the non-refugees (36 per cent - 38 per cent).

## 2.2 Composition of Refugees and Non-Refugees, by Economic Branch

Comparison of the employed by economic branch between refugees and non-refugees before the war with the distribution by branches after the war does not reveal any important changes (see table 4). It must be mentioned that the percentage of those employed in services and commerce rose after the war for all types of population. For example: in the refugee camps 19 per cent (1,400) were employed in services before the war, 26 per cent (1,100) after it. In other branches there was a decline in the percentage of workers.

## THE GAZA STRIP AND NORTH SINAI

### 1. General

#### 1.1 Population at Working Age

At the time of the census (Stage B), the population of the Gaza Strip and North Sinai was 394,000, which is equivalent to 66,800 households. About 84,400 men and 106,000 women of this population were at working age.

## 1.2 Employment Before the War

Of the 84,400 men at working age, about 46,000<sup>(a)</sup>, (55 per cent) were working before the war.

Age: The distribution of men working before the war according to age groups is shown in the following table:

TABLE H.- MEN (aged 15+) WHO WORKED BEFORE THE WAR, BY AGE

| A g e                 | 15-24  | 25-34  | 35-44  | 45-44 | 55-64 | 65+   |
|-----------------------|--------|--------|--------|-------|-------|-------|
| TOTAL                 | 26,568 | 14,115 | 14,461 | 8,958 | 7,426 | 9,365 |
| Worked before the war | 7,884  | 12,231 | 12,298 | 6,858 | 4,042 | 2,160 |
| % of men who worked   | 29.7   | 86.7   | 85.1   | 76.6  | 54.4  | 23.1  |

### Education

The percentage of men with nine or more years of study prior to the war was smaller than the percentage of those with less education who worked before the war. For example: about 59 per cent of the males with no education (0 years of study) were employed as compared with an employment rate of 42 per cent among those with nine or more years of study.

A combination of the age and education variables shows that 62 per cent of the men with 9+ years of study are 15-24 years if age, the corollary being that the low percentage of working men belonging to this education group is explained by its young-age composition.

(a) Some 1,600 men of whom it was not known whether they worked before the war, were divided proportionately between the employed and the unemployed.

TABLE I.- MEN (Aged 15+) WHO WORKED BEFORE THE WAR  
BY NUMBER OF YEARS OF STUDY

| Years of Study      | 0      | 1-4   | 5-8    | 9+     |
|---------------------|--------|-------|--------|--------|
| TOTAL               | 33,134 | 9,633 | 16,929 | 23,930 |
| Worked prior to war | 19,572 | 7,454 | 11,665 | 8,347  |
| % of men who worked | 59.1   | 77.4  | 68.9   | 34.9   |

## 1.3 Post-War Employment

About 26,900 of the men at working age stated that they were working after the war, and an additional 3,500 retained a place of work from which they were temporarily absent. The overall number of employed was, therefore, 30,400 men (which constitutes 36 per cent of all men of working age).

Out of the 57,500 unemployed men after the war: 7,200 were seeking work, 17,000 stated that they had not done so because "it is not worthwhile there is no work" (10,000 of them were employed prior to the war), 12,500 were pupils, 1,200 lived off their property and the remaining 12,000 were dependants, old-aged and sick, etc.

## 1.4 Comparison of Pre- and Post-War Employment

1.4.1 The number of men employed after the war was approximately one-third (about 16,200) less than the pre-war level.

1.4.2 About 54 per cent of those employed prior to the war were also working in September. For distribution by education of men who continued to work after the war, see Table J.

TABLE J.- PERCENTAGE OF MEN WHO WORKED BEFORE AND AFTER WAR,  
BY NUMBER OF YEARS OF STUDY

| Years of Study                                                                  | Total | 0    | 1-4  | 5-8  | 9+   |
|---------------------------------------------------------------------------------|-------|------|------|------|------|
| Percentage of men who worked after the war out of those who worked prior to war | 53.8  | 52.2 | 56.5 | 53.3 | 56.1 |

#### 1.5 Composition of Men Who Worked Before and After the War According to Occupation

Farmers fishermen, and those with related occupations comprised 23 per cent of the working males prior to the war, craftsmen and other industrial workers - 18 per cent, merchants and salesmen - 15 per cent, those employed in service occupations - 14 per cent, construction workers - 10 per cent. Professional, administrative and clerical workers, transport and communication workers comprised 6-7 per cent of the working males. A comparison of the distribution of occupations prior to and following the war is given in Table K.

#### 1.6 Composition of Workers by Economic Branch

About 27 per cent of the men working before the war were employed in services, 24 per cent in agriculture, 16 per cent in commerce, and 14 per cent in industry, crafts and quarries. An additional 9 per cent were employed in construction, with sanitation, water, and electricity accounting for only 1 per cent. The composition of employed after the war underwent no significant changes - see table 12.

The number of average work days per worker per week (males and females) was 5.4 after the war. For distribution of average number of work-days per worker in each economic branch, see table 14.

#### 1.7 Status at Work After the War

There were some 14,300 employees after the war, constituting 56 per cent of employed persons (32 per cent were monthly employees, 6 percent weekly wage earners, and 18 per cent - daily wage-earners).

#### 1.8 Employees and Wages Before the War

The number of employees who declared their income prior to the war was 27,800. Their average monthly wage amounted to 24.4 Egyptian pounds (equivalent to 146 Israel pounds at the exchange rate of IL. 6 to 1 Egyptian pound). The highest average monthly wage rate was registered in the services branch (E.L. 29.6) and the lowest - in agriculture (E.L. 18.5), see Table L.

#### 2. Type of Population

The refugee camps accommodated 180,000 inhabitants (30,200 households). About 58,300 (9,700 households) refugees lived outside the camps, as did 142,700 (24,200 households) non-refugees.

#### 2.1 Employment Preceding and Following the War

From the total refugee-camp population some 35,700 were men at working age. 18,000 (50 per cent) had worked before the war, 10,300 after the war, and another 1,300 were temporarily absent from work (together - 33 per cent). The refugee population residing outside the camps included 13,400 men of working age, 7,500 (56 per cent) of whom had worked prior to the war, 4,500 worked after the war with an additional 600 temporarily absent from work (38 per cent). Among the non-refugees there were 32,500 men at working age, of whom 18,700 (58 per cent) had worked before the war, 11,200 worked after the war and 1,500 were temporarily absent from work (together - 39 per cent).

#### 2.2 Composition of Refugees and Non-Refugees, by Economic Branch

A comparison of the distribution of economic branches among the refugees and non-refugees prior to and following the war reveals no significant differences - see table 12. The percentage of those employed in services increased after the war in all categories of the population, a change that was registered also in Judaea and Samaria.

#### COMPARISON WITH NON-JEWISH ISRAELI POPULATION

Among the non-Jews in Israel, there were, in 1966, about 80,800 men of working age (14+) (figure taken from the 1966 Labour Force Survey - yearly averages), of whom 58,100 (72 per cent) were employed.

TABLE K.- MEN, WHO WORKED BEFORE AND AFTER THE WAR,  
BY OCCUPATION

| Occupation                | Total  | Professional<br>workers | Managerial<br>and<br>clerical<br>workers | Merchants,<br>agents<br>and<br>salesmen | Farmers,<br>fisher-<br>men and<br>related<br>workers | Transport,<br>and<br>communica-<br>tions<br>workers | Construc-<br>tion<br>workers | Industrial<br>crafts-<br>men | Services<br>workers |
|---------------------------|--------|-------------------------|------------------------------------------|-----------------------------------------|------------------------------------------------------|-----------------------------------------------------|------------------------------|------------------------------|---------------------|
| After war                 | 45,689 | 2,638                   | 3,308                                    | 6,743                                   | 9,949                                                | 3,163                                               | 4,370                        | 7,767                        | 6,228               |
| Before war                | 26,881 | 1,755                   | 1,598                                    | 4,799                                   | 5,813                                                | 1,538                                               | 1,671                        | 3,706                        | 3,906               |
| Percentage<br>of decrease | 41.2   | 33.5                    | 51.7                                     | 28.8                                    | 41.6                                                 | 51.4                                                | 61.8                         | 52.3                         | 37.3                |

|---------------------------------------|-------|--------------------------------------------|---------------------------------------|---------------------------------------------|---------------------------------------------------|------------------------------------------|----------------------------------------------------|----------|
| Average<br>monthly<br>wage<br>in E.L. | 24.4  | 18.5                                       | 22.3                                  | 24.2                                        | 19.8                                              | 24.2                                     | 24.7                                               | 29.6     |

Table M. illustrates the composition of those employed, by economic branch, for Israeli non-Jews as compared to Judaea and Samaria and the Gaza Strip and North Sinai.

## CHAPTER B - DEFINITIONS AND EXPLANATIONS

### I. Demographic Characteristics

#### Type of Population

In the sample processings, households and individuals were divided into four groups according to the settlement of residence of the household head prior to the 1948 war, as follows:

Outside refugee camps:

- "non-refugees" - households whose heads lived outside Israel territory before the 1948 war;
- "refugees" - households whose heads lived in Israel territory before the 1948 war;
- "not-known" - place of residence of household heads before the 1948 war is not known, or cannot be classified, or where the household head was born after that war.

Inside refugee camps: households living inside refugee camps, the majority of whom originate from Israel territory.

On processing, all persons belonging to a household were classified into the same type of population as the head of the household.

#### Years of Study

The object of the question put to the enumerated person was to ascertain the overall number of years spent by him in study at the various schools he had attended and not to find out what class level he had reached. In cases where the enumerated person stated that he had attended the same class for two years, both years were recorded.

Age. The enumerator's directives stated that the age should be defined according to the last day of the enumerated person and that special attention should be paid to determining those belonging to age group zero. Notwithstanding this, it is known that the Arab population, especially the elderly, tend to be inexact when stating age.

## II. Employment

"Worked" - includes full or part-time work for wages, profit or any other form of remuneration; work of the self-employed or work in the family business including: household member (wife, child) employed in agricultural work a few hours a week; apprentices, apprenticeship in courses against payment, and pupils' work in agricultural or vocational schools.

"Worked after the war" - the work undertaken during the week ending the last Friday before enumeration.

"Sought work" - includes those persons who actively sought work; tried to establish a business, or applied in person or in writing to firms or friends with the intention of securing employment.

"Why did he not seek work?" - the enumerated persons who were unemployed after the war and answered that they had not sought work were questioned as to the "reason" for refraining from doing so. The answers received were classified according to the following criteria:

1. The enumerated person has a place of work from which he was absent during the last week, and expects to return to it.
2. "There is no use in looking for work as there is none to be found" - people who did not seek work due to the market situation because they think they cannot find work. (Many of these were employed before the war).
3. Was engaged in household chores.
4. Studied.
5. Lived off his property - does not seek work because he possesses property off which he lives.
6. Is dependant, sick, old, or a pensioner.
7. Other - includes the enumerated whose "reason" for not seeking work could not be classified under the above criteria.

TABLE M.- EMPLOYED MEN, BY ECONOMIC BRANCH - IN ISRAEL, JUDAEA AND SAMARIA, THE GAZA STRIP AND NORTH SINAI

|                                                   | Total | Agriculture, forestry and fishing | Mines, industry and crafts-manship | Construction and public works | Electricity, water and sanitary services | Commerce, banking and insurance | Transport, freight, storage and communication | Services |
|---------------------------------------------------|-------|-----------------------------------|------------------------------------|-------------------------------|------------------------------------------|---------------------------------|-----------------------------------------------|----------|
| Non-Jews (a) in Israel - 1966 Labour Force Survey | 100.0 | 36.3                              | 16.3                               | 22.1                          | (0.9)                                    | (7.4)                           | (6.7)                                         | 10.3     |
| Judaea and Samaria - Pre-War 1967 Survey          | 100.0 | 34.6                              | 15.1                               | 15.6                          | (0.9)                                    | (12.3)                          | 6.8                                           | 14.7     |
| Gaza Strip and North Sinai - Pre-War 1967 Survey  | 100.0 | 23.9                              | 13.9                               | 9.2                           | (1.3)                                    | 16.3                            | 8.5                                           | 26.9     |

(a) Figures relating to non-Jews employed in Israel, by economic branch, include also those absent.

"Worked before the war" - any work performed before the war (June 1967).

Average number of man-days worked per worker - total number of man-days worked at all places of work during the week preceding the census, divided by the number of workers.

Economic branch - description of main activity of establishment, business, institution, or employer for whom the enumerated person worked.

Occupation - main type of work in which the enumerated person was engaged at his place of employment.

Status at work - status of the enumerated at his place of employment.

Employee - a person employed by another in an establishment, business or in agriculture, etc. on a wage - or any other basis:

Employee (monthly) - a person who received his wages monthly under a monthly-wage agreement:

Weekly wage-earner - a person who receives a weekly wage:

Daily wage-earner - a person who receives a daily wage, including hourly-wage workers:

Self-employed - a person who works in his own business without employing others for wages or any other form of remuneration.

A self-employed person is also one who:

1. is a partner in a business not employing others;
2. employs others without remuneration (family members who receive no payment);
3. is an agriculturalist who cultivates his own or leased lands, either unassisted or with the help of members of his family (working without payment).

Employer - a person who employs others for wages or any other form of remuneration, or is a partner in a business employing others (a person employing domestic help or others without payment is not considered an employer).

Average wage - total wage divided by the number of wage-earners whose wage is known.

### III. Limitations of the Results

This publication (fourth in the series) presents data on the Labour Force characteristics of the adult (15+) population, the occupational and branch composition of the employed, and the average wages of the wage earners. These data were accumulated in the course of the Census of Population and Housing 1967 conducted in the territories administered by the I.D.F. The census procedures and its organization were outlined in publication No. 1 in this series. Details relating to the sampling method (Stage B) and the estimates drawn from the sample can be found in publication No. 2.

#### Limitations of the Data

As in any statistical processing, the results of this census are also subject to a number of limitations:

a. Response errors and errors in processing - these errors result from inaccurate replies as described above, from errors in recording, coding, punching or processing including imputations for defective answers. It should be noted that a part of these errors tend to cancel each other in the totals.

b. Errors resulting from the sampling:

Biases due to the fact that, firstly, the household sample and the households actually investigated and processed were not fully identical because of defects in enumerating the sample and, secondly, because the population included in the "supplementary registration" (a) was not investigated by the questions of Stage B. When processing and inflating the data, the sample characteristics for each stratum were imputed also for the population of the "supplementary registration" by means of a proportional estimate; this, however, led to certain minor biases, for instance, regarding estimates of households and total population (of 15+ years of age).

(a) See publication No. 1 of the series of the Census of Population - 1967, pp. 26-27.

### Sampling Errors

The estimates suffer also from errors that result from the fact that the survey was based on a sample and not on a complete census of all households. As the sample included some 20,000 households in Judaea and Samaria and about 11,000 in the Gaza Strip and North Sinai, the sampling errors are very small for estimates referring to large groups (e.g. total population) and to common occurrences. On the other hand, as the estimates refer to smaller geographical groups (e.g. individual settlements) or to rarer occurrences, the effect of the sampling errors increases.

Rough estimates were made in order to caution the reader in respect of estimates for which the sampling error might be grave.

The criteria for publication are:

### Persons

1. Data relating to over 750 persons or percentages based on denominators of this size. Here the sampling error is estimated as less than 30 per cent and no special notation was used for these figures. (It should be noted, however, that these figures may also be affected by other errors noted above).
2. Data relating to 250-750 persons or percentages based on a denominator of this size. These figures were put in parantheses to indicate that they are subject to high sampling error.
3. The remaining data were put in double parantheses to indicate that they are subject to a very high sampling error.

### Confidence Intervals

Let  $P$  be the percentage of households with a given characteristic,  $\hat{P}$  the estimated percentage according to the sample, and  $N$  the estimated total on which the percentage was calculated. The following table shows the bounds within which  $P$  may be found with a probability of 95 per cent, the "95 per cent confidence interval for  $P$ ". The estimate was computed by employing a formula in which we used rough estimates (fairly arbitrary) as intra-group correlation factors.

### Average Weekly Man-days Worked per Worker

In computing the averages, the number of days put in by the workers in the course of a week was divided by the number of workers. When more than 350 workers were registered in the box, the average was given without any special marking. Averages computed for 120-350 workers were put in parantheses to indicate that they are subject to a high sampling error, while those computed for less than 120 workers were put in double parantheses to indicate that they are subject to a very high sampling error.

### Average Monthly Wage per Worker

In this computation the monthly wages total was divided by the number of wage earners.

CONFIDENCE INTERVAL OF 95 PERCENT FOR VARIOUS VALUES OF  $\hat{P}$  AND  $\hat{N}$

| $\hat{N}$ Estimate of the total population (households) | $\hat{P}$ - Estimates of percentage |          |          |          |           |           |                    |

| 10,000                                                  | 0.2-3.7                             | 0.4-5.2  | 2.1-9.3  | 5.7-15.4 | 15.0-28.8 | 22.7-37.3 | $\hat{P} \pm 7.6$  |
| 20,000                                                  | 0.2-2.6                             | 0.7-3.9  | 2.8-7.8  | 6.9-13.7 | 15.8-24.7 | 24.8-35.2 | $\hat{P} \pm 5.4$  |
| 50,000                                                  | 0.4-1.9                             | 1.1-3.2  | 3.5-6.6  | 8.0-12.2 | 17.3-22.8 | 26.7-33.3 | $\hat{P} \pm 3.4$  |
| 100,000                                                 | 0.5-1.5                             | 1.4-2.7  | 4.0-6.2  | 8.5-11.6 | 18.0-22.0 | 27.7-32.3 | $\hat{P} \pm 2.4$  |

Examples for the use of a table of confidence interval:

- a. If  $\hat{N} = 5,000$ ,  $\hat{P} = 5$ , we obtain that the census proportion is within the confidence limits of 95% between 1.2% to 11.5%.
- b. For a  $\hat{P}$  larger than 40%, for example  $\hat{P} = 40\%$ ,  $\hat{N} = 5,000$ , half the width of the confidence interval is 10.4% and thereof the proportion of the population is in the confidence of 95% between 29.6% to 40.4%  $\pm 4.0\%$  to  $\pm 4.0\%$  + 0.04 to 0.01 + 0.04 = 4.04%.

THE ADMINISTERED TERRITORIES

Additional Data from the Sample Enumeration

Jerusalem, 1970

## P R E F A C E

The Central Bureau of Statistics is pleased to present to the public the fifth and last volume in this series of census publications which was conducted in the areas administered by Israel in August-September, 1967.

This volume includes completions of a few subjects which had already appeared in previous volumes and which have been compiled from the detailed data: marital status, fertility, infant mortality, emigration of sons/daughters, labour force and housing.

Information is also given on the distribution of adults enumerated in 1967, in the areas administered by Israel, by their place of residence before the 1948 war. These data are based on a 20 per cent sample enumeration of the population.

The 1967 Census in the areas administered by Israel was very valuable to the administration and research staff enabling them to obtain conclusive statistical information on the population in these areas: its size, composition, factors of its growth, labour force and housing conditions, receiving of assistance, etc.

This census serves as a base for the official statistics on the population which has been compiled since, in the administered areas.

It is my pleasant duty to express once again the Bureau's appreciation to the Israel Defence Forces Headquarters who assisted in carrying out the Census in the Administered Areas. We also express our thanks to the numerous members of the staff who planned and conducted the Census and published its results. The names of these in charge of the various activities were given in the first publication of this series.

Prof. R. Bachi  
The Government Statistician

Jerusalem, 1970.

## INTRODUCTION

The data presented in this publication were obtained during the Census of Population and Housing 1967, conducted in the areas administered by the I.D.F. For details on the Census procedures and organization see publication No. 1 of this series.

The problems dealt with in this publication were included in the sample investigation which covered 20 per cent of the households (Stage B questionnaire). As for the sampling method, estimates for the whole population, sampling errors and limitations of the results, see Chapter B in publication No. 2 and Chapter B in publication No. 3 of this series. For definitions and explanations of the classifications appearing in this publication, see Chapter C of publication No. 2 and Chapter C of publication No. 3.

The present publication presents data in various subjects, most of which are a continuation and completion of the subjects published in publications Nos. 2 and 3 of this series.

CENSUS OF POPULATION AND HOUSING

(1966/67)

EAST JERUSALEM

Jerusalem, 1968

## P R E F A C E

This publication comprises detailed results of the East Jerusalem Census - 1967 which was carried out by the Central Bureau of Statistics on 27 IX 1967. The Census was commissioned by the Jerusalem Municipality and financed by it.

This publication presents detailed data on the composition of population by sex, age and religion in the various areas of East Jerusalem and data on housing conditions, receipts of assistance, household equipment and cultivation of farms. These data were obtained from the full enumeration of the population present in East Jerusalem on the census day.

Also included in this publication are data from the sample enumeration (50 per cent of enumeration districts) on the following subjects: detailed demographic characteristics, emigration, fertility, infant deaths, level of education, occupation and unemployment among the inhabitants of East Jerusalem.

The Census was planned hurriedly in a time shorter than usually required. No doubt, the full co-operation of the population and municipality of Jerusalem, the I.D.F. and the Israel Police contributed to the success of the Census; I wish to thank all for their co-operation, especially Mr. M. Benvenesti who is in charge of East Jerusalem on behalf of the Municipality and who was of great help in the preparations for the Census. The list of the senior staff who took part in the Census can be found overleaf.

In addition to the senior staff, over one thousand temporary workers were employed in carrying out the enumeration.

It is my pleasant duty to thank all those who participated in the planning and carrying out the enumeration, processing of the data and its publishing. Only thanks to the great efforts of the senior staff during the preparation period of the Census and its execution, was it possible to complete this difficult task.

Prof. R. Bachi  
The Government Statistician

Jerusalem, 1968.

## STAFF IN CHARGE OF CENSUS

### Directorate of the Bureau

Prof. R. Bachi, R. Baron, Dr. U. Schmelz, R. Roter, Mrs. H. Even-Tov

### Census Headquarters

E. Ben-Amram, Miss M. Giller, Dr. G. Nathan, R. Roter

### Main Field Workers

|                               |                             |

## INTRODUCTION

## MAIN FINDINGS

### I. GENERAL

#### Size and Geographic Distribution of the Population (Tables 2, 3, based on full Census)

In East Jerusalem 65,857 persons were enumerated on 27th of September, 1967, of whom 23,675 or 36 per cent were found to live within the Old City walls, 25,039 or 38 per cent in the northern quarters and 17,143 or 26 per cent in the southern quarters. Another 20,700 lived in neighbouring areas within the Jordanian municipal boundaries which comprised both Silwan and Abu Tur. About 21,500 lived in formerly independent settlements now included in the municipal boundaries of united Jerusalem.

Over half the inhabitants of the Old City (13,538) were living in the Moslem Quarter. In the Jewish Quarter of the Old City 3,500 Moslems were found who had moved there after the 1948 war. Least populated of the four quarters of the Old City was the Armenian Quarter which had a population of only 2,391.

In the Northern Quarter, 9,593 persons were found to live in areas close to the town (the American Colony, Sheikh Jarrah and Wadi el Jose) and 366 on Mount Scopus within the area of the Hebrew University. The rest were found in the more distant suburbs of Shu'aft and East Beit Khanina, in the former villages of Tur and Isawiya and around the Atarot airport. In the South Quarter, 11,101 persons were found to live in the immediate vicinity of the Old City (in Silwan and Abu Tur), while the rest were living in Zur Bahir and Um Tuba, East of the Bethlehem Road, and in the former Jordanian section of Beit Safafa village, West of the Bethlehem Road.

The Jerusalem city boundaries were extended by an area of close to 67 sq.km. as a result of the Six Day War (excluding the Shu'aft camp and the qibbuz of Ramat Rahel, see Definitions). In this entire area of East Jerusalem the population density was found to be 988 inhabitants per sq.km. The entire city at the time of the Census was found to have a population of 265,000, 25 per cent of it in East Jerusalem, making it the second largest city in Israel. The municipal boundaries comprised

an area of 104 sq.km. with a population density of 2,548 inhabitants per sq.km.

#### Comparison with the Jordanian Census of 1961

It is difficult to draw up an exact comparison with the findings of the Jordanian census conducted on November 18th, 1961, since the northern part of the new area now comprised in the municipal boundaries, comprises sections of various settlements which in the Jordanian census were enumerated separately. It may also be that the boundaries of the geographic units in the Eastern part of Jerusalem in both censuses were not exactly the same. Roughly it may be assumed that the population in the areas formerly under Jordanian control which are now comprised within the municipal boundaries was about 75,000, according to the 1961 Census, as follows:

TABLE A.- COMPARISON BETWEEN 1967 (Israeli) AND 1961 (Jordanian) CENSUS

|                                        | 1961<br>Jordanian<br>Census | 1967<br>Census | Percentage<br>of Change |
|----------------------------------------|-----------------------------|----------------|-------------------------|
| EAST JERUSALEM - TOTAL                 | (75,000)                    | 65,857         | (- 12.2)                |
| Jordanian municipal boundaries - total | 60,488                      | 44,369         | - 26.6                  |
| Old City (within the walls)            | 36,801                      | 23,675         | - 35.7                  |
| Outside the walls                      | 23,687                      | 20,694         | - 12.6                  |
| REMAINING AREA (total)                 | (15,000)                    | 21,488         | (+ 43.3)                |
| Tur                                    | 4,289                       | 5,701 (c)      | + 32.9                  |
| Isawiya                                | 1,163                       | 1,613          | + 38.7                  |
| Shu'aft                                | 2,541                       | 3,400          | + 33.8                  |
| Eastern Beit Khanina(a)                |                             | 3,609          |                         |
| Atarot airport(b)                      | (2,000)                     | 1,123          | ..                      |
| Sur Bahir, Um Tuba                     |                             |                |                         |
| (and Arab el Suheira)                  | 4,012                       | 4,710          | + 17.4                  |
| Beit Safafa (former Jordanian part)    | 1,153                       | 1,332          | + 15.5                  |
| and Sharafat                           |                             |                |                         |

- (a) The whole of Beit Khanina had 3,067 inhabitants in 1961 so that the population has grown considerably.
- (b) Only parts of settlements have been included in the present municipal boundaries.
- (c) Including 366 persons living within the area of the Hebrew University (see Definitions).

It may be concluded from this comparison:

- That there is a fairly good correspondence between the two censuses as regards the geographic distribution of the population. The considerable decline in the number of persons living inside the Old City and the substantial growth of the new built-up areas of Shu'aft and East Beit Khanina is compatible with the natural trend to move to the suburbs.
- The population of the areas newly included within the municipal boundaries has grown considerably during the period of 6 years that has elapsed between the two censuses.
- The decrease in the population of the former Jordanian municipal area - despite the appreciable natural increase - was accordingly due to the negative migration balance, partly resulting from departures incidental to the Six Day War, but to a far greater extent from a population movement to areas outside the former municipal boundaries and the considerable emigration to the East Bank and to other countries, which took place throughout the period of Jordanian rule not only from Jerusalem but from Judaea and Samaria as well. This emigration is evidenced by numerous official Jordanian publications and above all by the 1961 Census. The data collected in the 1967 Census on "sons and daughters abroad" (see below) show that this trend continued right up to the Six Day War.

#### Religion (Tables 1; 3, full census data)

Of the total population of East Jerusalem, 54,081 or 83 per cent were Moslems. 10,795 or 17 per cent Christians and 981 belonged to the group "other religion and not known" (mostly people whose religion was not ascertained in the Census and the 96 Jews stationed in the Hebrew University area on Mount Scopus).

The percentage of Christians who were found to live in East Jerusalem was lower than in Bethlehem, Beit Jala and Beit Sahur where they make up 56.0 per cent of the overall population and than in Ramallah and Bira where they account for 34 per cent of the total. Nevertheless their percentage was higher than in other urban settlements in Judaea and Samaria and than in these areas generally (5 per cent).

The Greek Orthodox community was found to be the largest, with 3,984 members, followed by the Latin church with a membership of 3,663. Then came Greek Catholics with 1,173 members while the remaining 1,975 Christians belonged to various sects. In some cases, the church affiliation was not specified.

The highest proportion of Moslems - over 95 per cent - was found in the former Jewish Quarter of the Old City which was seized by the Moslems after the 1948 War, as well as in Silwan, Abu Tur, Zur Bahir and Um Tuba. The proportion was lowest in the "Christian" and "Armenian" Quarters of the Old City, with 12 and 37 per cent, respectively. A relatively low rate of Moslems was also found in the Old City as a whole (72 per cent) and in the American Colony and Sheikh Jarrah (76 per cent). In the Western part of the American Colony (57 per cent), in Beit Khanina (73 per cent) and in the Hebrew University area (58 per cent).

#### Type of Population (Tables 6, 38, sample data)

The distinction made in these tables was based on the place of residence of the head of the household before the 1948 War.

Households were classified into refugee and non-refugee households according to whether the head of the household was living in Israeli territory before 1948 or not. Thus 9,526 non-refugee households were found comprising 48,818 persons and 2,331 refugee households with 11,567 persons. In respect of 728 households numbering 3,229 persons, the residence of the head of the household before 1948 was not known. of the households whose status could be ascertained, 80.3 per cent were non-refugee households comprising 80.8 per cent of the population - about the same percentages as in Judaea and Samaria generally. Again, the proportion of the population belonging to refugee households was similar as in Judaea and Samaria.

The percentage of refugees was higher among Christians (37 per cent) than among Moslems (15.6 per cent), there also being a higher percentage of Christians(a) among refugees (31.9 per cent) than among non-refugees (12.9 per cent). Accordingly, a percentage of refugees higher than the municipal average was found in those sub-quarters where Christians are preponderant - the "Christian" and "Armenian" Quarters of the Old City (31 per cent), Shu'aft, and Beit Khanina (31 per cent), the American Colony and Sheikh Jarrah (28 per cent). The percentage of refugees was particularly low in the southern part of the area comprising semi-rural districts with a Moslem population.

Other data analyses concerning the 1948 refugee problem are shown under "personal place of residence before 1948" and "households registered with UNRWA" and in the relevant tables (see below).

(a) Including other religion and not known.

## 2. DEMOGRAPHIC CHARACTERISTICS

Age (Tables 1, 2, 4, 5 - full census data, and tables 7 and 8 - sample data)

Table B shows the distribution of the population of East Jerusalem by main age groups compared with the age distribution of the inhabitants of Judaea and Samaria, the principal towns of these districts, other territories held by the Israel Army, and of the State of Israel. Some of the comparisons with Table B are also made by religious community.

TABLE B.- AGE DISTRIBUTION (Percentages)

|                                                | All Age Groups | 0-14 | 15-29 | 30-44 | 45-64 | 65+ |
|------------------------------------------------|----------------|------|-------|-------|-------|-----|

| Thereof: Jerusalem (1965)                      | 100.0          | 34.1 | 24.5  | 17.9  | 16.5  | 7.0 |

(a) Not including refugee camps.

There is a striking difference between the Christian and Moslem population of East Jerusalem: the Christians have fewer children and a rather high representation of the adult age groups (30 and above) so that their population is much "older" than the Christian population of Judaea and Samaria and of the State of Israel and comes closer to the age distribution of the Jewish population.

Generally Christians in Israel and in the territories under Israel administration have a lower fertility rate than the Moslems so that the percentage of children is lower. That this difference is still more pronounced among the Christians of East Jerusalem is, however, probably due to the fact that they are made up of both Arab and other Christians, including priests and monks who have no children at all. On the other hand the Moslem population of East Jerusalem is extremely fertile and its age distribution is very close to that of the general population in the territories administered by Israel, and of the Moslem population of Israel, although the percentage of children is not as high as in Israel owing to the higher infant mortality rate. In East Jerusalem, moreover, the 15-29 age group was more highly represented than in Judaea and Samaria, probably because more young people of Judaea and Samaria had emigrated..

The age distribution of the population of East Jerusalem is determined not only by the fact that it consists of heterogeneous groups with different fertility rates but also by the emigration balance. While there was continuous emigration from East Jerusalem long before the Six Day War and as a result of it (see below "sons and daughters abroad") there also was a migration movement to the city both of 1948 refugees and of others (see below "settlement of birth", "settlement of residence before the 1948 War"). The resultant overall age structure in East Jerusalem is similar to that of the general population of Bethlehem, Beit Jala and Beit Sahur and of Ramallah and Bira, two urban areas with a high percentage of Christians. On the other hand it is also similar to the age structure found in Nablus if the population in the refugee camps is excluded.

In Jerusalem the 0-14 age group was less highly represented among the refugees (42 per cent) many of whom are Christians, than among the non-refugees (47 per cent). The median age of both sexes was 17.8 years - of Moslem 16.0, of Christians 26.8, of non-refugees 16.6 and of refugees 18.9. The rate of children aged 0-14 was low in the following areas: in areas with a high percentage of Christians (and consequently residents of institutions), 20 per cent in the Hebrew University area, 26.6 per cent in the western part of the American Colony, 29.5 per cent in the Christian Quarter, 33.0 per cent in the Armenian Quarter of the Old City and 34.8 per cent in Sheikh Jarrah. On the other hand there was a particularly high rate of children in the former Jewish Quarter of the Old City which

was occupied by Moslems and in several formerly rural areas almost exclusively inhabited by Moslems - Isawiya, Silwan, Abu-Tur, Zur Bahir and Um Tuba. Here children comprised about 50 per cent of the total population.

The 15-29 age group comprises 20 to 25 per cent of the population of all sections of East Jerusalem except the Western part of the American Colony and the Hebrew University area - the districts with the lowest percentage of children - where this age group constitutes 28 and 41 per cent, respectively, and the Atarot airport area, where it constitutes 32 per cent. The 65 and above age group is particularly highly represented in the Armenian quarter, with 9 per cent, and the Christian quarter with 10 per cent, as well as in the Beit Safafa and Sharafat areas with 11 per cent.

Sex (Tables 2-5, according to the full census data, and Tables 7 and 8 according to the sample survey)

East Jerusalem was found to have a surplus of males both in the total and Moslem population of all ages and in the total and Moslem population aged 0-24. This slight surplus of 1,027 men per every 1,000 women aged 15-44 stands in striking contrast to the marked shortage of men of these ages in all other areas administered by I.D.F. (Table C) which seems to be the result of the differential emigration of the two sexes before and after the Six Day War.

Considering that there also was emigration from East Jerusalem, as from the rest of these territories, there presumably was a considerable movement from country to town which made up for the shortage of males. The existence of this population shift is confirmed by the fact that also in other major towns of Judaea and Samaria the ratio between men and women aged 15-44 is less abnormal than in the villages and refugee camps (see Table C and Publication No. 1 of the 1967 Population and Housing Census in the areas held by the I.D.F.).

The ratio between men and women among the Christians of East Jerusalem was found to be lower than among the Moslems. This cannot be explained by the population living in institutions.

(a) Excluding refugee camps.

Family Status (Tables 8-11 according to the sample survey)

Thirty-nine per cent of the total male population of East Jerusalem (aged 15 and above) was found to be unmarried, 59 per cent married, and 2 per cent widowed. In the same age group 25 per cent of the women were found to be unmarried, 60 per cent married, one per cent divorced and 14 per cent widowed. The percentage of unmarried men and women was higher among the Christians than among the Moslem community, partly because the Christian population includes monks, nuns and priests. Those sections of East Jerusalem which have a high proportion of Christian residents accordingly have a higher than average ratio of unmarried men and women, particularly the Christian and Armenian quarters of the Old City, and for women also the American Colony - Sheikh Jarrah, Shu'aft and Beit Khanina.

From the percentages of single men and women in the different age groups, as shown in Tables 8-11, the following conclusions may be drawn regarding the prevailing marriage habits:

- Also among the Moslems a not inconsiderable portion of the population does not marry until the end of the age of fertility. In the 45-54 age group 6 per cent of the men were unmarried - 6 per cent of the Moslems and 9 per cent of the Christians - and 7 per cent of the women - 5 per cent of the Moslems and 11 per cent of the Christians(a) (excluding monasteries and similar institutions).
- Christians of both sexes tend to marry later than Moslems. Accordingly the "refugees" who include a higher percentage of Christians than the general average marry later than the "non-refugees".

A comparison with Judaea and Samaria - largely rural districts - shows that there the percentage of persons who do not marry at all is smaller and the age of marriage is lower not only in the population as a whole but also in the Moslem community. No notable differences were found between the Christian and Moslem women in East Jerusalem in the percentage of widows, in the different age groups.

Relationship to Head of Household (Table 12 according to sample survey)

For every 100 persons aged 15 and above there were 37 heads of households, 25 women married to heads of households, 27 sons and daughters, 2 sons or daughters in law, 3 brothers or sisters of the head of the household, 3 parents, 2 other relatives and 1 person who was not a

(a) Including other religions and not known.

relative; 19 per cent of household heads were women. On the other hand according to the family relationship to the household head, more mothers or mothers-in-law were found among women (5 per cent) than fathers and fathers-in-law among men (0.8 per cent).

Number of Years of Study (Tables 13-16 according to the sample survey)

Of the total adult population in East Jerusalem (aged 15 and above) 67 per cent had attended school - 79.0 per cent of the men but only 55 per cent of the women. On the other hand there were not substantial differences between the sexes in the distribution by number of years of schooling, except that men were more highly represented in the top group with 13 years of schooling or more. Out of every 100 men who had attended school, 59 had at least 7 years of schooling, 39 at least 8 years, and 9 at least 13 years of schooling. The respective percentages for the women were 54, 35 and 6 per cent.

Hence the level of education in East Jerusalem was considerably higher than in Judaea and Samaria generally, and among the Non-Jews in Israel most of whom are villagers, but about the same as in the main towns in Judaea and Samaria and the urban Non-Jewish population in Israel.

Schooling was more common among Christians than among Moslems, and among refugees than among non-refugees, of the same religion. However, while only 75.2 per cent of Moslem men and 46.3 per cent of Moslem women who were "non-refugees" had attended school, 93.7 and 87.1 per cent of Christian(a) "refugees" had received a formal education.

The same ranking by religion and type of population was also found to prevail regarding those who had at least 9 years of schooling of whom among the Moslem refugees there were 32.8 and 25.9 respectively, per every 100 men and women who had any schooling at all as against 59.8 and 50.7 for every 100 Christian refugees(a).

By religion, type of population and sex the level of education among the adult population was found to go up in the lower age groups, showing the gradual improvement in the school attendance rate. Whereas 98 per cent of all men and 90 per cent of all women aged 15-19 had been to school, the corresponding rates for non-refugee Moslems aged 65 and above were 33 and 8 per cent.

There were more people who had some schooling in those sub-quarters which had a higher percentage of Christians and particularly few in Zur Bahir and Beit Safafa (65 per cent of the men and 22 per cent of women) and

(a) Including other religions not known.

among the women in Silwan and Abu-Tur (40.6 per cent). In these sub-quarters the percentage of people with post-elementary school among those who had attended school was also lower.

Migration Movements

The following three census questions give some indication of population shifts:

a) The settlement of birth (Table 17 according to the sample survey).

It was found that 75 per cent of all adults (aged 15 and above) enumerated in East Jerusalem were born either within the present boundaries of the Eastern part of the city or in the Western part, - only 59 per cent of the "refugees" but 78.5 per cent of the rest of the population.

b) Persons aged 21 years and above by personal place of residence before 1948 (Tables 17-18 according to the sample survey).

Under "type of population" all household members enumerated were classified by the settlement in which the head of the household in 1967 census had lived before 1948. A further enquiry was made into the personal place of residence of all persons aged 20 years and above before 1948(a). Of those who reported their former place of residence, 83 per cent of members of "refugee" households were found to have been living in Israel territory and 3 per cent of members of non-refugee households. Presumably those whose personal place of residence was different from that of the head of the household had joined the family by marriage or otherwise only after 1948. Although the absolute numbers of these cases is not much different among refugees and non-refugees, there is a considerable difference in relative terms because of the disparate size of the refugee and non-refugee groups. For every 100 non-refugees who lived outside Israel territory before 1948, 86 lived within the present boundaries of East Jerusalem, and for every 100 refugees who lived within Israel territory before 1948, 57 lived in West Jerusalem. Out of every 100 persons aged 21 years and above, enumerated in East Jerusalem in 1967, 79 had lived in Jerusalem before 1948 - 68 in the Eastern part and 11 per cent in the Western part.

c) Sons/daughters living outside the territories administered by Israel (Tables 19-22 according to the sample survey).

The head of the household was asked whether he had any sons or daughters living outside the areas administered by Israel and if so, when

(a) 83 per cent of persons (aged 20 and above) of "refugee" households and 3 per cent of persons (aged 20 and above) of "non-refugee" households.

each of them had left and in what country he or she were living. Below we shall refer to both sons and daughters simple as "sons living abroad".

It was found that 27 per cent of all household heads in East Jerusalem had sons living abroad; 13 per cent-one son and 7 per cent 2 sons; 3 and more sons - 7 per cent. The families in East Jerusalem reported that they had 6,896 sons living abroad - more than 10 per cent of the population enumerated. This figure does not include whole families who had left the city or individuals who left no parents behind. These data show that there was a considerable tendency to emigrate to the East Bank and to other countries, although slightly less than in Judaea and Samaria as a whole were 33 per cent of all family heads reported they had sons living abroad. As in Judaea and Samaria the proportion of heads of families with sons living abroad was slightly higher among the refugees (32 per cent) than among the rest of the population (26 per cent). About 22 per cent had left during the year preceding the Census, most of them before the Six Day War, per each 100 sons abroad left: during the year preceding the Census - 22 per cent; 38 per cent 1-4 years ago, 20 per cent 5-9 years ago and 20 per cent 10 years ago or more. In this distribution no appreciable difference was found between refugee and non-refugee families.

The percentages of sons/daughters staying abroad who had left during the year preceding the Census was slightly lower (22 per cent) than in Judaea and Samaria (26 per cent).

By country of stay the distribution was found to be as follows: 35 per cent were staying in Jordan, 20 per cent in Kuwait, 7 per cent in Saudi Arabia, 17 per cent in other countries of Asia and Africa, 8 per cent in Europe and 13 per cent in America. Thus there were fewer in Jordan and Kuwait and more in Europe and America of those who came from East Jerusalem, than from Judaea and Samaria. There also were fewer refugees than non-refugees who chose the East Bank.

#### Fertility (Tables 23-25 according to the sample data)

Every non-single woman aged 15-60 was asked about the number of children born during her lifetime. Data were also collected on children born during the last five years, mainly with a view to assessing the infant mortality rate. This information, however, is also helpful in establishing the current fertility rate.

Women of the category aged 45-49 - i.e. beyond the age of fertility - reported an average of 8.6 children each. The average went up with age, reached its peak in the 45-49 age group and then went down again apparently mainly because the respondents forgot the number of children born to them, encountered also in other censuses among Arabs and other populations where the older women have a lower standard of education. The distribution of the 45-49 age group by the number of children borne was as follows: 3 per cent had never borne any children, 13 per cent had had 1-4, 13 per cent 5-6,

15 per cent 7-8, 15 per cent 9-11, and 41 per cent 11 children and more. The average number of children was higher among those who were married at the time of the Census (8.9) than among the widows and divorcees (6.8). The average was also much higher among Moslem married women (9.7 per cent) than among the Christians(a) (6.0). The average further varied with the mother's level of education: (the data apply to married women at the time of the Census) married women who had no schooling at all or 1-4 years had an average of 9.8 children, women with 5-8 years of schooling, an average of 7.5 and women with 9 years of schooling or more - an average of 4.6. The last two findings are interconnected since the Christian women were found to have a higher standard of education than Moslem women (see above). The fertility rate was somewhat lower among refugees than among non-refugees, partly because of the higher proportion of Christians among the refugees, though the average number of children of married Moslem women aged 35-54 was also found to be lower among the refugees though hardly any difference was noted in the younger age groups.

In the 45-49 age group the average number of children was found to be the same in East Jerusalem as in Judaea and Samaria (8.6), whereas the average for married Moslem women in East Jerusalem was higher (9.7 as against 8.9).

#### Infant Mortality (Tables 26, 27 according to the sample survey)

All non-single women aged 15-60 were asked about the number of children they had had in the last 5 years and how many of them died. Though presumably the answers did not exactly cover a period of five years, the ratio between births and deaths seems to be properly represented. About 17 per cent of all children born during the 5 years preceding the Census were reported to have died, less than in Judaea and Samaria (21 per cent) because presumably the sanitary conditions in East Jerusalem were better. The differences between Moslems and Christians and "refugees" and "non-refugees" were slight. As was to be expected, the infant mortality was higher among very young women and among women reaching the end of the period of fertility. Of those who gave birth only once during the 5 years preceding the Census, only 6 per cent lost their child while 85 per cent of the women who bore 5 children or more lost at least one of them.

#### C. EMPLOYMENT AND WAGES (Tables 28-37 according to sample survey)

##### Employment Before and After the 1967 War (applies mainly to men)

About 11,500 or 67 per cent of the 17,100 men (ages 15 and above) of working age stated that they had been working before the war. At the

(a) Including other religion and not known.

time of the census 8,500 reported that they were actually working and about 1,000 that they had a job from which they were temporarily absent so that about 9,500 or 56 per cent were employed, i.e. 76 per cent of those who were working before the war were employed or temporarily absent from their jobs.

Of the 7,600 men who were not working, about 1,000 had been seeking work during the week preceding the census, and about 2,000 said it was not worth while seeking since there was no work; of these about 600 had not been working before the war, either. The rest were pupils (2,000), pensionnaires, old and sick people (1,900) while about 200 were living on their income from property, etc. (see Table 29). In comparing the number of persons employed after and before the war, it should be borne in mind that the data relate to the month of September when the schools were still closed and few public work projects had as yet been commenced.

b) Working male population, by economic branch, before and after the war

There was hardly any difference between the economic branch distribution before and after the war.

c) Work Status

Some 5,300 of the 8,500 men who were working after the war were employees - about 3,000 on a monthly, about 600 on a weekly and about 1,700 on a daily basis. Another 2,700 were either self-employed or employers and about 500 were helping in the family business without remuneration or people whose work status could not be elicited.

d) Wages

Average employees' wages before the war were 27.0 dinars per month or about IL. 270 at the present rate. Average monthly wage scales by economic branch, type of population and occupation are shown in Tables 36 and 37.

Type of Population

About 3,300 of the men of working age were "refugees" and the remaining 12,900 were "non-refugees". Of the latter about 8,700 or 67 per cent had been working before the war and about 6,400 after the war while about 800 (56%) were temporarily absent from their jobs. Again among the "refugees" about 2,200 or approximately 67 per cent were working before the war. About 1,600 were also working afterwards while 210 were

TABLE D. - MEN WORKING BEFORE AND AFTER THE 1967 WAR

|                | Percentages      |                                   |                            |                               |                                          |                                 |                                      |          |

temporarily absent from work (about 55%). Table 29 gives a more detailed breakdown of labour force characteristics of the "refugees" and "non-refugees" before and after the war. As may be seen from tables 30 and 31, the economic branch distribution of the two categories was not substantially different either before or after the War.

#### D. HOUSEHOLDS

Type of Residence - Households or Institutions (Tables 1,2 according to the census data).

Only 2,755 persons or 4.2 per cent were found to live in institutions while 63,102 persons lived in 12,368 households. The percentage living in institutions varied considerably from one area to another. In the Hebrew University area they accounted for 77 per cent, in the Western American Colony for 24 per cent, in Sheikh Jarrah for 12 per cent, in the Christian Quarter of the Old City for 10 per cent, in the Armenian Quarter for 7 per cent, in Beit Safafa / Sharafat (including monasteries in the vicinity of Beit Jallah) for 10 per cent, in Abu-Tur for 6 per cent and in all the remaining districts for less than 5 per cent.

Characteristics of the Head of the Household (Tables 39 and 40 according to the sample survey).

Of the 12,368 household heads 10,183 or 81 per cent were men; 10,015 were Moslems (80 per cent), and 9,526 or 80 per cent of all cases whose population type was known, were non-refugees. Fifteen per cent were below the age of 30, 35 per cent belonged to the 30-44 age group, 34 per cent were 45-64 years old and 16 per cent 65 and above.

Number of Persons per Household (Tables 1 and 2 according to the full census and Tables 38-41 according to the sample survey).

The 12,368 households comprised 63,102 persons so that the average number of persons per household in the whole of East Jerusalem was 5.1. This seems rather high compared with Judaea and Samaria as a whole, where the average was found to be 4.9, and with the average households size found in the major towns (without refugee camps) - 5.1 in Hebron, 4.8 in Bethlehem, Beit Jala and Beit Sahur, 4.7 in Ramallah and Bira and 5.7 in Nablus. The average in East Jerusalem is much higher than in the western part of the city where it stood at about 4 in 1966, but less than among Non-Jews in Israel (5.7 in 1966). The variations in household size are probably determined by the fertility rate, infant mortality, migration and the living habits of adult family members.

The size of the average Moslem household in East Jerusalem was found to be 5.3 - bigger than the average size of households of other communities which was 4.1. This is in line with the differential fertility rates of Moslems and Christians as indicated above. There also is a marked difference in the average size of households headed by men (15.5) and by women (3.3). On the other hand the difference between refugee and non-refugee households is negligible (5.0 as against 5.1). Households headed by persons aged 30-44 were found to be bigger (6.0 on a general average and 6.3 for Moslems) than households headed by older people.

Twenty six per cent of households had 1-2 members and 31 per cent had 7 members and more. Out of every 100 persons living in households 54.3 were found in households of 7 persons or more.

The average household size was higher in areas with a higher proportion of Moslems. Wadi el Joz had the highest average of 6.2 while in the Armenian and Christian quarters of the Old City the average was particularly low - 3.8 and 3.6 respectively.

#### E. HOUSING CONDITIONS

As against an average household size of 5.1 the average number of rooms was 2.2 so that the mean housing density was 2.4 persons per room. About 40 per cent of all households lived in 1 room, about 27 per cent in two rooms, about 18 per cent in 3 rooms and about 15 per cent in 4 rooms and more. The proportion of households with 4 rooms and more was higher among refugees than among non-refugees (about 20 as against 13 per cent). In West Jerusalem on 11 per cent of dwellings in 1966 contained 4 rooms or more.

About 79 per cent of the dwellings included a kitchen (7 per cent for the exclusive use of the household); about 62 per cent had an inside toilet, about 70 per cent - electricity, some 41 per cent - tap of running water inside the dwelling and about 27 per cent a bathroom.

Marked differences were found between refugees and non-refugees, with the refugees enjoying a higher standard of facilities. Thus about 73 per cent of all refugee households had an inside toilet as against 61 per cent of non-refugee households (see Tables 46, 47). This may be largely due to the fact that most of the non-refugee population is rural. Thus in the barely urbanised village of Zur Bahir only 19 per cent had an inside toilet and a mere 18 per cent had electricity (see Table 46). A high standard of facilities was on the other hand found in the distinctly urban quarters - the American Colony - Sheikh Jarrah, Shu'aft, Beit Khanina, and the Christian and Armenian Quarters of the Old City (see Table 45).

On the average households having the various facilities inquired into were bigger - as was also found in Judaea and Samaria. Thus households with electricity numbered an average of 5.3 members as against 4.8 members in households without electricity.

The standard of facilities in East and West Jerusalem, in the other urban settlements of Judaea and Samaria and among non-Jews in urban settlements in Israel was found to be highly differential, as may be seen from the following table:

TABLE E. - HOUSEHOLDS WITH VARIOUS FACILITIES IN JERUSALEM  
(East and West), URBAN SETTLEMENTS IN JUDAEA AND  
SAMARIA AND NON-JEWISH URBAN SETTLEMENTS IN ISRAEL

|                            | East<br>Jerusalem | West<br>Jerusalem | Urban<br>Settlements<br>in Judaea<br>and Samaria | Non-Jewish<br>Urban<br>Population<br>in Israel |
|----------------------------|-------------------|-------------------|--------------------------------------------------|------------------------------------------------|
| Kitchen                    | 28.6              | 94.1              | 74.7                                             | 83.0                                           |
| Electricity                | 70.1              | ..                | 71.0                                             | 79.5                                           |
| Toilet inside the dwelling | 61.5              | 96.4              | 76.5                                             | 64.9                                           |
| Tap inside the dwelling    | 40.5              | ..                | 56.9                                             | 80.3                                           |
| Bathroom                   | 26.6              | 84.9              | 41.7                                             | 43.2                                           |
| Average housing density    | 2.40              | 1.63              |                                                  | 2.43                                           |

#### Household Equipment

About 8,100 households or 67 per cent of the total were found to have a radio set, about 820 or 7 per cent - TV and 2,600 or about 22 per cent - an electric refrigerator.

TABLE F. - PERCENTAGE OF HOUSEHOLDS WITH HOUSEHOLD EQUIPMENT,  
BY TYPE OF POPULATION

| Household Equipment   | Total (a) | Non-Refugees | Refugees |
|-----------------------|-----------|--------------|----------|
| Households - Total    | 12,369    | 9,524        | 2,332    |
| Radio                 | 67.1      | 66.9         | 75.5     |
| Television            | 6.7       | 5.2          | 10.8     |
| Electric refrigerator | 21.7      | 19.4         | 33.9     |

(a) The total was obtained from the full census and the data by type of population from a 50 per cent sample survey.

As in the case of housing facilities it was again found that the standard of refugee households was higher than of non-refugee households.

#### F. U.N.R.W.A. - ASSISTANCE

About 23 per cent of all households stated that they were registered with UNRWA or received assistance from this Agency - about 47 per cent of refugee and 21 per cent of non-refugee households. Some 7 per cent reported that they were receiving assistance from relatives abroad and another 4 per cent were receiving assistance from UNICEF, CARE or other sources. The average size of households receiving assistance or registered with UNRWA was 5.3.

## LIMITATIONS AND ERRORS

Every census or statistical operation is liable to errors<sup>(a)</sup>. The speed with which this census was prepared and carried out, the large number of workers involved and the difficult conditions under which it was conducted obviously increase the incidence of errors which, all the efforts of the Central Bureau of Statistics were unable to forestall or correct. There are two principal types of errors: in coverage and in response.

a. Coverage

These errors comprise:

(1) Non-inclusion of residents in the Stage B sample survey.

The detailed primary mapping determining the number of each house, block and parcel and the advance inspection of the area by the senior census staff (crew leaders and above) as well as the curfew that was imposed while the census was taken and the procedure by which houses already enumerated were appropriately marked, all helped to attain proper coverage of all structures, households and persons. Nevertheless a small percentage of the population may not have been enumerated. Thus, although special vehicles were used, enumerators sometimes did not manage to get to isolated out of the way places where the roads were barely passable and possibly mined.

(2) Household questionnaire

Non-completion of the household questionnaire. As stated, every household was supposed to fill in a household questionnaire but in some cases Stage A questionnaires were filled in for the individual members of the household but the household questionnaire was either not filled in or not forwarded for processing.

(3) Stage B questionnaire (personal)

Under or miscoverage in the Sample Survey. The Stage B questionnaire was not filled in for a number of statistical areas included in the sample or for only part of them while

(a) See Chapter II in "Procedures and Definitions", Publication No. 25 of the Population and Housing Census 1961, The Central Bureau of Statistics, 1965.

on the other hand it was filled in for areas of parts of areas which should not have been included in the sample.

b. Response Errors

These errors are the result of discrepancies between the answers processed and the real answers and may be due to the following reasons:

- (1) Wrong answers because questions were not properly understood, owing to regional differences in Arabic dialects, or because of lack of knowledge (e.g. of the wife's age, although enumerators were instructed to consult available documents), because of intentionally misleading replies (e.g. questions of employment and wages) and as a result of the tendency to state people's ages in round figures.
- (2) Wrong entries. Sometimes the enumerators failed to understand the replies or made a mistake in recording them. One of the subjects in which there was a certain amount of confusion on the part of the enumerators, was the distribution of the population into households.
- (3) Coding errors. In spite of the careful checks carried out to ensure proper coding at the head office, errors may have crept in.
- (4) Punching the response. The data obtained in the Census questionnaires have been punched; despite the checking procedures, errors crept in, e.g. a punching of a wrong code number or the shifting of fields within the punch-cards because of incorrect completion of the questionnaires (which caused errors in other fields too).
- (5) Imputations. After the material was punched it was checked for logical consistency and in case of inconsistencies automatic corrections were made (partly by transferring the respective data to not-known).

The first quality checks show that the results are on the whole reasonably correct and reliable. In drawing up comparisons with former data relating to East Jerusalem, attention should be paid to possible divergencies between the definition of the variables examined and the municipal boundaries (see Definitions).

## METHODS OF ESTIMATION

To obtain estimates relating to the total population from the sample survey data (Stage II personal questionnaire), they obviously had to be multiplied by the appropriate raising coefficient. Moreover, since the household questionnaire was not filled in for all households included in the full census an adjustment coefficient had to be used so that the data appearing in the tables should correspond to the total number of households according to the Stage I questionnaires.

### (a) Raising Coefficients

Although the sample theoretically included half the enumeration districts, the raising coefficient is generally either more or less than 2 and varies from 1.7 to 3.0. The reasons for this are:

- (1) that the size of the enumeration districts was not the same;
- (2) that there was a certain amount of non-coverage, as discussed under Limitations and Errors.

The raising factor F was determined separately for each sub-quarter, as follows:

$$F = \frac{\text{Total population aged 15 and above in Stage A (a)}}{\text{Total population aged 15 and above in Stage B}}$$

This method does not make for full correspondence between the total number of households and of persons in both stages. Discrepancies are bound to occur as a result of sampling errors. The different methods used to obtain and process the data material in the two stages of the Census caused slight differences between the average number of persons per household and number of those aged 15 and above. Thus in Stage I the total number of households in East Jerusalem was found to be 12,400 as against 12,600 in Stage II, while the number of persons not living in institutions was 63,100 in Stage I as against 63,600 in Stage II. For the various quarters the difference was throughout less than 4 per cent.

- (a) Not including persons aged 15 and above living in institutions, who are not represented in Stage B.

## Adjustment coefficients

The adjustment factor T was determined separately for each sub-quarter. It ranged from 1.00 (for cases where the household questionnaire was filled in for every household) to 1.16, and was calculated as follows:

$$T = \frac{\text{Total number of households in Stage I (according to the cards punched for each unit)}}{\text{Total number of households for which household data were obtained.}}$$

It is given for all household tables and computed in such a way as to ensure that the total number of households shown in the tables should correspond to their total number in Stage I of the questionnaire.

As in the case of the inflated sample data the number of persons in the various categories according to the adjusted data was not quite the same as the number of persons according to the Stage I figures because the section of the population for which no envelopes were filled in, did not have the same population average as the population as a whole. Concerning total persons (excluding institutions), both stages agree: 63,100 persons, while in both stages the count of persons in the different sub-quarters shows variations of up to 2.5 per cent.

## SAMPLING ERRORS

### a. Biases

Biases were caused by the fact that the households actually investigated and processed were not exactly the same as those selected for the sample. A further bias was caused by the method of estimation. For while the ratio estimate made it possible to obtain good data for the total number of persons aged 15 and above, in each sub-quarter it led to some biases in respect of other variables.

### b. Sampling Errors

The estimates also contain errors due to their being based on a sample rather than on a full enumeration of all households. The sampling errors in the data for Jerusalem as a whole are smaller than in the data for each sub-quarter. There has not yet been enough time to compute accurate sampling error estimates and only very rough estimates could so far be drawn up. The data were accordingly published in such a way as to warn the reader when he might expect a high sampling error. Other errors were ignored in this classification.

### c. Rules of Publication

- 1) Data with a relative sampling error of less than 30 per cent are printed without any special notation.
- 2) Data with a relative sampling error of 30 to 50 per cent were put in parantheses.
- 3) Data with a relative sampling error of over 50 per cent were put in double parantheses.

### d. Confidence Interval

A 95 per cent confidence interval of the estimated proportion  $\hat{P}$  shows with a confidence of 95 per cent the space within which that proportion would have been obtained in a full census. Confidence intervals relating to households, age groups of women, employment and occupation, are shown for the tables to help the reader evaluate the statistical significance of the data. In determining these confidence intervals, all non-sampling errors were ignored. For the demographic tables the confidence intervals can be determined according to those tables. For the wage tables no confidence intervals were given because of the considerable response errors involved.

#### Use of Confidence Interval Table

In the following 95 per cent confidence interval table for variables  $\hat{N}$  and  $\hat{P}$ ;  $\hat{N}$  in columns 1-4 is the estimated total number of households or of women in each age group. In column 5,  $\hat{N}$  is the estimated total number of men aged 15 years and above, by labor force characteristics, economic branch distribution or occupation.  $\hat{P}$  is the estimated percentage of the characteristic investigated. A confidence interval of 95 per cent means that the data which would have been obtained for the respective characteristics in a full census would at a confidence level of 95 per cent be somewhere between the figures shown. The last column shows the confidence interval for  $50\% > \hat{P} \geq 30\%$ .

For each  $\hat{N}$  column the corresponding numbers of the relevant Stage II tables are given.

#### Example 1.

Table 22 showing the distribution of households by the number of sons and daughters staying abroad, 23 per cent of households in Silwan and

CONFIDENCE INTERVAL OF 95 PER CENT FOR VARIOUS VALUES OF  $\hat{P}$  AND  $\hat{N}$   
APPLYING TO HOUSEHOLDS, AGE GROUPS OF FEMALES, EMPLOYMENT(a) AND OCCUPATION

| Estimate of Total Population of Households, Age Groups of Females, Employment and Occupation by Number of Table of Stage B of the Census | $\hat{P}$ |         |         |          |           |           | Size of Simple Random Sample N |
|------------------------------------------------------------------------------------------------------------------------------------------|-----------|---------|---------|----------|-----------|-----------|--------------------------------|
|                                                                                                                                          | 1%        | 2%      | 3%      | 10%      | 20%       | 30%       | 30%+                           |
| Number of Table 23, 42, 26 $\hat{N}$                                                                                                     | 0.5-2.2   | 1.0-4.4 | 2.5-9.6 | 6.2-15.6 | 14.6-26.8 | 23.4-36.6 | $\hat{P} \pm 7.2$              |

| Number of Table 22 $\hat{N}$                                                                                                             | 0.5-2.2   | 1.0-4.2 | 3.1-7.9 | 7.2-13.7 | 16.1-24.6 | 25.3-34.7 | $\hat{P} \pm 5.1$              |
| Number of Table 39, 41, 43, 48, 54, 46, 47, 42 $\hat{N}$                                                                                 | 0.5-2.2   | 1.2-3.6 | 3.4-7.3 | 7.7-12.9 | 16.8-23.7 | 26.2-33.8 | $\hat{P} \pm 4.2$              |
| Number of Table 28, 29, 30, 31, 32, 33 $\hat{N}$                                                                                         | 0.5-2.0   | 1.3-3.3 | 3.6-6.9 | 7.9-12.5 | 17.2-23.2 | 26.7-33.3 | $\hat{P} \pm 3.6$              |
|                                                                                                                                          | 0.5-1.9   | 1.3-3.1 | 3.7-6.7 | 8.2-12.2 | 17.5-22.8 | 27.0-33.0 | $\hat{P} \pm 3.2$              |
|                                                                                                                                          | 0.5-1.7   | 1.4-2.9 | 3.9-6.3 | 8.5-11.8 | 17.9-22.2 | 27.7-32.3 | $\hat{P} \pm 2.6$              |
|                                                                                                                                          | 0.5-1.6   | 1.5-2.7 | 4.0-6.1 | 8.7-11.5 | 18.2-21.9 | 27.9-32.1 | $\hat{P} \pm 2.3$              |
|                                                                                                                                          | 0.6-1.4   | 1.6-2.5 | 4.3-5.7 | 9.0-11.0 | 18.7-21.3 | 28.5-31.5 | $\hat{P} \pm 1.6$              |

(a)  $\hat{P}$  50 per cent can be obtained from the table, confidence interval 5.  $\hat{Q} = 1 - \hat{P}$

Abu Tur have sons or daughters abroad. The total number of households in Silwan and Abu Tur is 2,012. The confidence interval for the percentage of sons or daughters staying abroad is determined as following: reference to column 3 in the confidence interval table in which Table 22 is listed. Since the total number of households is 2,012 the  $\hat{N}$  nearest to this figure must be selected, i.e. 2,100. Since  $\hat{P} = 23$  per cent and this value is not tabulated, the extremes of the confidence interval for  $P = 20$  per cent and  $\hat{N} = 2,100$  are the most appropriate, i.e. 15.4 per cent and 25.2 per cent, to which another 3 per cent must be added, constituting the difference between  $\hat{P} = 23$  per cent and  $\hat{P} = 20$  per cent. Since the percentage of households in Silwan and Abu Tur having sons or daughters abroad may be set at between 18.4 and 28.2 per cent, at a confidence level of 95 per cent. Since the table is given in absolute figures, it is first necessary to compute the percentage or to look up the corresponding percentage table in order to determine the confidence intervals.

#### Example 2.

Table No. 23 shows unmarried women aged 15-60 by family status, age and the average number of children borne. The total number of women listed is 10,892, and the total number of women aged 15-19 is 567, constituting 5.1 per cent of the total. To determine the confidence interval for this estimate, reference should be made to the column showing  $\hat{P} = 5$  per cent and take the confidence interval for the  $\hat{N}$  in column 1 closest to 10,892, i.e. 8,000. Accordingly the confidence interval for the percentage of women aged 15-19 is between 4.0 to 6.3 per cent.

#### Confidence Interval for Other Tables.

Here the percentage, out of the total shown in the table, must be computed, the corresponding  $\hat{N}$  is taken from another table, as indicated below and reference is made to the corresponding column referring to this table.

| The Table from which $\hat{N}$ is taken (by No.) | Table (by No.)   |
|--------------------------------------------------|------------------|
| 22                                               | 20, 21           |
| 39                                               | 7, 8, 10, 14, 15 |
| 40                                               | 12               |
| 41                                               | 6, 9, 11, 16, 18 |
| 43                                               | 44               |
| 44                                               | 49               |

#### Example 1.

Table No. 7 relates to the distribution of persons by "refugee" or "non-refugee" status and by age. The total number of persons is 63,612 and the 35-39 age group comprises 5.1 per cent. The appropriate  $\hat{N}$  shown in column 4 of table 39 (households) is selected as follows: the total number of households is 12,588 so that the corresponding  $\hat{N}$  in column 4 is 15,000 which is the closest to 12,588. The confidence interval for the percentage of the 35-39 age group thus lies between 3.9 and 6.3 per cent.

#### Example 2.

Table 10 shows the 15-29 age group by type of population, sex, age and family status. Altogether there are 14,458 persons of this age group, 646 or 4.5 per cent of them unmarried men. The appropriate  $\hat{N}$  in column 4 of Table 39 is 15,000. Since the  $\hat{P} = 4.5$  per cent and this value is not listed, the confidence intervals for  $P = 5$  per cent should be taken, deducting 0.5 per cent from each end, which is the difference between  $\hat{P} = 5\%$  and  $\hat{P} = 4.5\%$ . Thus, the confidence interval for the percentage of single men in the 25-29 age group is between  $3.9 - 0.5$  and  $6.3 - 0.5$  per cent, i.e. between 3.4 to 5.8 per cent.

## DEFINITIONS AND EXPLANATIONS

Census date - 27 September, 1967.

Census area - the area added to the municipal boundaries of Jerusalem by the order of the Minister of the Interior published in the Official Gazette of 28 VI 1967, excluding the refugee camps near Shu'aft and the qibbuz of Ramat Rachel.

Census population - all persons actually found on the premises by the census enumerators during their house-to-house calls and not including persons absent from their homes unless a special permit was presented.

Type of residence - members of households and persons living in institutions.

Households - persons present at the time of the Census who lived together in the same premises and customarily had most of their meals together, including guests present on the premises during the Census.

Institutions - hospitals, boarding schools, monasteries, hotels and the like.

Total household members, household members aged 15 and above - in the sample census all household members aged 15 and above were enumerated by means of a special questionnaire while the total household members were taken from the full census questionnaire. The number of household members aged 0-14 in the sample data was thus obtained by subtracting household members aged 15 and above from the total population enumerated in the full census.

Religion - in processing the data, all household members were classified according to the religion reported by the head of the household.

Settlement of birth - respondents were asked whether they were born in Jerusalem and the questionnaire contained an express remark that the question referred both to East and West Jerusalem. The census enumerators were provided with a list of all quarters included in the present municipal boundaries.

Type of population by place of residence of the head of the household before 1948 - in processing the data from the sample, households and household members were classified into:

non-refugees - households the head of whom was not living in Israel territory before 1948;

refugees - households the head of whom was living in Israel territory, including West Jerusalem, before 1948;

not known - households of whose household head the place of residence before 1948 could not be ascertained or classified, or households whose head was born after the 1948 War.

All household members were placed in the same category as the head of the household.

Personal place of residence before 1948 - this question (No. 9 in the personal sample questionnaire) was not formulated in the same way in the previous censuses conducted in the territories held by the Israel Army, and the replies were classified as follows:

born after 1948 - household head a non-refugee;

born after 1948 - household head a refugee;

born after 1948 - status of household head not known;

East Jerusalem;

other place of residence outside Israeli territory;

West Jerusalem;

other place of residence within Israeli territory;

Jerusalem - section not known;

not known.

Replies were elicited only from persons aged 15 and above. All persons aged 15-20 were comprised in the first three categories, including those who stated they were 20 years old in view of the general tendency to round off one's age. They were then classified according to the "type of population" of the head of the household which was determined according to his place of residence before 1948 (see above). Persons aged 21 and above were classified according to their own place of

residence before 1948 into those who were living outside Israeli territory - in East Jerusalem or elsewhere, those who were living within Israeli territory - in West Jerusalem or elsewhere, and those whose former place of residence could not be ascertained or classified.

Age - the census enumerators were instructed to fix the respondent's age according to their last birthday and to pay special attention to the 0 age group. Since Arabs are, however, notorious for misstating the age especially of women and older people, it is doubtful whether these instructions were fully effective.

Relationship to the head of the household - the relationship to the head of the household was classified as set out in question No. 6 of the personal questionnaire of the sample (see questionnaire). These data relate only to the adult population aged 15 and above. The person indicated by the members of the household as the head of the household was taken as such.

Number of years of study - according to the instructions issued to the census enumerators this question referred to the total number of years during which the respondent attended various institutions of learning as: kuttab school, elementary school, secondary school, vocational school, teachers' training college, religious seminar, university and the like, but not including short-term courses, correspondence courses, private lessons and independent study. Months of schooling were rounded off to full years. The question related to the number of years studied and not to the grade attained and if the same class was repeated the respondent was considered to have had two years of schooling.

Sons/daughters of the head of the household staying outside the territories administered by Israel - heads of households were asked whether they had any sons or daughters residing or staying outside the territories administered by Israel and if so how many years ago they had left and in what country they were staying at the time of the Census.

Fertility - all non-single women aged 15-60 (including the 60-year olds, in view of the tendency to round off one's age) were asked about the number of children they had born during their lifetime, including those who had died in the meantime but not including miscarriages and stillbirths. Further data were obtained by means of questions Nos. 11 and 12 regarding the number of children born during the five years preceding the census date (see questionnaire).

Infant mortality up to the age of 5 - all non-single women aged 15-60 were asked about the number of children they had born during the past five years who were still alive and who had died in the meantime. The total number of children born in the five years preceding the Census

and the percentage of children that had died could be established by combining the answers to both questions, though presumably the replies did not relate exactly to that period.

#### Employment

Worked - persons working full-time and part-time, for wages, profits or any other consideration, in their own or in a family business, including household members (children, women) engaged in agricultural labour several hours a week, apprentices, paid trainees and the labour of pupils of agricultural or vocational schools.

Worked after the war - work done during the last week ending on the last Friday before the census date.

Sought work - all persons actively seeking work, seeking to set up a business or having applied personally or in writing to friends or establishments to find a job.

Reasons for not seeking work - persons found not to have been working after the War who stated that they had also not done so. The replies were classified as follows:

1. absent from work during the week in question but hoping to return to it;
2. not seeking for work because of the situation on the labour market and the poor chances of finding employment (a considerable proportion of these had been working before the War);
3. doing housework;
4. studying;
5. living off his property;
6. supported, ill, old, retired;
7. others, including respondents whose reasons could not be classified under any of the above categories.

Worked before the war - any work done before June, 1967.

Average number of work days per worker - the number of days of work in all jobs in which persons working during the week preceding the Census were engaged, divided by the number of persons so engaged.

Economic branch - the main field of activity of the establishment, business, institution or employer for whom the respondent was working (based on the classification of the Population and Housing Census, 1961).

Occupation - the main type of work engaged in by the respondent (based on the classification of the Population and Housing Census, 1961).

Work status - classified as follows:

Employee - a persons working for somebody else, in an establishment, business, farm, etc., for wages or any other remuneration;

monthly employee - a person drawing a monthly salary on the basis of a contract;

weekly employee - a person receiving weekly wages;

a daily labourer - a persons receiving daily wages including persons working by the hour;

self-employed - a person working in his own business and not employing anybody else for wages or any other consideration. This category includes:

1. partners in firms without employees;
2. persons employing other without remuneration (unpaid family members);
3. farmers cultivating their own land or tenant farmers working on their own or with the help of unpaid family members.

Employer - a persons employing others others for wages or any other remuneration or partners in firms employing other persons, not including persons employing other persons without remuneration or employing household help.

Mean monthly wages - total wages and salaries divided by number of employees (excluding those whose wages and salaries are not known).

#### Housing conditions

Type of building - classified according to the material from which the outer walls are made:

hard building - buildings whose outer walls are made of stone, concrete blocks;

clay building - buildings whose outer walls are made of clay;

other buildings - any other structure whose outer walls are made of cloth, tarpaulin, sheet metal, wood, asbestos, as well as caves and huts, etc.

Number of rooms - including living, dining and bedrooms, guest rooms, entrance hall and the rooms of all lodgers included in the household, but not including storerooms, kitchens and conveniences.

Average housing density - the number of persons divided by the number of rooms.

Electricity - premises were considered to have electricity even if at the time of the Census the current was disconnected.

Source of water for household use -

water tap inside the dwelling;

water tap in the yard;

private well - well or cistern used exclusively by the household;

public well - well or cistern used by a number of households (including wells and cisterns from which water is supplied for a change);

others - water taken from a spring, a river, from neighbours, etc.

Bathroom - a separate room used for washing -

for the exclusive use of the household;

shared with one or more households;

no bathroom.

Kitchen - separate room used solely for cooking and preparing of meals:

for the exclusive use of the household;

shared with one or more households;

no kitchen.

Toilet - for the exclusive use of the households;

shared with one or more households;

inside the dwelling;

outside the dwelling (if the members of the household have to walk in the open to get to it).

#### Household equipment

Radio - a household was considered to have a radio if it had at least one radio working on house (alternate) current, or batteries or a transistor set.

Television - only sets on residents' premises and not including TV sets in public localities such as cafes, hotels, etc.

Refrigerator - electric refrigerators.

UNRWA assistance - households receiving both food and services, services but no food, or merely registered with UNRWA were all considered to be receiving UNRWA assistance.

Assistance from relatives abroad - all persons regularly receiving financial assistance from relatives abroad (monthly, quarterly, etc.) were included in this category.

Other assistance - regular assistance received by households from such authorities or agencies as UNICEF, Government Welfare Bureaux, religious community institutions, etc.

#### Geographic distribution

East Jerusalem was divided along the same lines as West Jerusalem and all other major urban settlements in Israel according to the principles set out in Publication No. 1 of the Population and Housing Census 1961 Series. In making this statistical distribution special attention was, however, paid to the historical divisions of the built up area and to the inclusion in the present municipal boundaries of several rural settlements separated by areas that are not built up.

East Jerusalem was divided into three regions - the Old City within the walls, the northern quarter outside the walls, and the southern

quarter outside the walls (see map). Each of these quarters was divided into sub-quarters and groups. The quarters and their sub-units were numbered consecutively starting with number 5, the four quarters of West Jerusalem bearing numbers 1-4. The quarters, sub-quarters and statistical areas into which East Jerusalem was divided are as follows:

#### 5. The Old City quarter

- 5.1 sub-quarter - "Christian quarter";
- 5.2 sub-quarter - "Armenian quarter";
- 5.3 sub-quarter - "Jewish quarter";
- 5.4 sub-quarter - "Moslem quarter", divided into 3 statistical areas:

5.41 S.A.

5.42 S.A.

5.43 S.A.

#### 6. Northern quarter

- 6.1 sub-quarter Tur, Wadi el Jose;

6.11 S.A. Tur;

6.12 S.A. Isawiya;

6.13 S.A. Hebrew University area;

6.14 S.A. Wadi el Jose;

- 6.2 sub-quarter American Colony, Sheikh Jarrah;

6.21 S.A. American Colony - East;

6.22 S.A. American Colony - West;

6.23 S.A. Sheikh Jarrah.

- 6.3 sub-quarter Shu'aft, Beit Khanina;

6.31 S.A. Shu'aft;

6.32 S.A. Beit Khanina;

6.33 S.A. Atarot airport.

#### 7. Southern quarter

- 7.1 sub-quarter Silwan, Abu Tur;

7.11 S.A. Silwan

7.12 S.A. Abu Tur, High Commissioner's Palace;

- 7.2 sub-region - Zur Bahir, Beit Safafa;

7.21 Zur Bahir, Um Tuba;

7.22 Beit Safafa; Sharafat.

Altogether East Jerusalem was thus divided into 3 quarters, 9 sub-quarters and 17 statistical areas. The four parts of the Old City which traditionally are considered to be separate quarters were for reasons of historical piety each regarded as a sub-quarter although the population of three of them was not big enough to warrant this. The "Hebrew University area" comprises the Mount Scopus area which was Israeli territory also before 1967 as well as the Augusta Victoria hospital and houses inhabited by Arabs in the direction of Tur and elsewhere. The Beit Safafa - Sharafat S.A. also includes the area containing Christian monasteries on Beit Jala.

CENSUS OF POPULATION  
AND HOUSING

(1967)

EAST JERUSALEM  
Part II

Jerusalem, 1970 .

## P R E F A C E

The Central Bureau of Statistics presents herewith to the public the second and last volume of the publication concerning the results of the census carried out in East Jerusalem in September 1967.

This volume contains additional data for a number of subjects: marital status, fertility and infant deaths, emigration of sons or daughters, labour force and living conditions. These data are based on the 50% sample enumeration of the population.

The census which was carried out in 1967 in East Jerusalem, supplied comprehensive statistical information on its population; this was of help to the administrative staff of the united city and of the state, to the planners, researchers etc. The census data also made possible the inclusion of the East Jerusalem inhabitants in the regular demographic statistics of Israel.

The Bureau wishes to express its thanks to the Jerusalem Municipality, in particular to Mr. Benbenisti for their assistance in the preparation of the census. Thanks are also due to the numerous staff members who took part in planning and carrying out the census and those who published its results. The names of the persons who were in charge of the various stages, were listed in the first volume of these census publications.

Prof. R. Bachi  
The Government Statistician

## INTRODUCTION

Data presented in this publication were obtained within the frame of the Population and Housing Census 1967. The boundaries of the census included the area added to the Jerusalem Municipality, excluding the refugee camp in Sha'aft, which numbered 2,732 persons, and Ramat Rachel.

For organization and processes of the census, see the first publication East Jerusalem of the Population and Housing Census 1967 Publications Series.

The questions dealt with in this publication, were included in the sample investigation which comprised about 50% of the households - questionnaire stage "B" for every person aged 15 and above. The demographic data - tables 1-24, are based on these questions. Questions on housing were asked by means of a full enumeration - data on these questions are given in tables 25 and 26 of this publication.

For the sample method, the estimates for the entire population, the sampling errors and the limitations of the data and also for explanation and classifications, see publication East Jerusalem, Part I.

This publication comprises data on various subjects which are mainly a sequel to, and a completion of the information concerning the same subjects appearing in East Jerusalem Part I.
